Cosmic-ray transport from AMS-02 B/C data: benchmark models and interpretation

Y. Génolini, M. Boudaud, P.-I. Batista, S. Caroff, L. Derome, J. Lavalle, A. Marcowith, D. Maurin, V. Poireau, V. Poulin, S. Rosier, P. Salati, P. D. Serpico and M. Vecchi

PHYSICAL REVIEW D 99, 123028 (2019)

Goal: -> To provide up-to-date transport benchmark models (and their uncertainties) in the context of AMS-O2 very small uncertainties.

Method:

- -> No global fit.
- -> New modelling ingredients.
- -> New fitting procedure.

- I Novelties and benchmark models
- II Subtleties of the fitting procedure
- III Main results!

II - Subtleties of the fitting procedure

III - Main results!

ICRC -- 29/07/19

Analysis performed with USINE V-3.5 propagation code.

USINE documentation

Welcome to USINE, a library with several semi-analytical Galactic cosmic-ray (GCR) propagation models (PDF version of documentation $\frac{1}{2}$ here).

We hope you will enjoy using USINE whether you want to:

- learn and know more about CR propagation phenomenology, taking advantage of the simple command-line interface and graphical pop-ups to quickly see and compare the importance of various ingredients on the resulting fluxes;
- perform state-of-the art analyses of new CR data, taking advantage of the very flexible ASCII
 parameter file to select your model, configuration, etc., to fit your data with any number of free
 parameter (transport, source, geometry...) and nuisance parameters (cross sections, data
 systematic uncertainties...);
- develop and use you own semi-analytical model without having to spend years setting all inputs and outputs right, taking advantage of the modularity and flexibility of the USINE C++ library.

If you use USINE, please cite Maurin (2018)

For any question, contact D. Maurin (LPSC).

We solve semi-analytically the famous propagation equation in a 1D geometry:

 $-\vec{\nabla}_{\mathbf{x}}\left\{K(E)\vec{\nabla}_{\mathbf{x}}\psi_{\alpha}-\vec{V}_{c}\psi_{\alpha}\right\}+\frac{\partial}{\partial E}\left\{b_{tot}(E)\psi_{\alpha}-\beta^{2}K_{pp}\frac{\partial\psi_{\alpha}}{\partial E}\right\}$ $+\sigma_{\alpha} v_{\alpha} n_{\rm ism} \psi_{\alpha} + \Gamma_{\alpha} \psi_{\alpha} = q_{\alpha} + \sum \left\{ \sigma_{\beta \to \alpha} v_{\beta} n_{\rm ism} + \Gamma_{\beta \to \alpha} \right\} \psi_{\beta}$. . Intermediate-rigidity Low-rigidity **High-rigidity** $\sigma_{\beta \to \alpha}$ K(E) σ_{α} V_{c} K_{pp} $b_{\rm tot}(E)$ $\approx 5\,\mathrm{GV}$ $\approx 300 \, \mathrm{GV}$

- -> Diffusion is assumed to be *homogeneous* and *isotropic*.
- -> We introduce several breaks in the diffusion coefficient:

Y. Genolini, D. Maurin, I. Moskalenko and M. Unger et al PRC 034611 (2018) : Current status and desired precision of the isotopic production cross sections relevant to astrophysics of cosmic rays. Li, Be, B, C, N

ICRC -- 29/07/19

II - Subtleties of the fitting procedure

Best fit propagation parameters with uncertainties increasing the number of XS as nuisance following Y.G et al PRC 034611 (2018)

handled with *nuisance* parameters on : force field approximation

ss section : NSS nuisance method

ICRC -- 29/07/19

II - Subtleties of the fitting procedure

Best fit propagation parameters with uncertainties increasing the number of XS as nuisance following Y.G et al PRC 034611 (2018)

ndled with *nuisance* parameters

Two methods of nuisance

— Using Galprop or Webber XS

Three conclusions :

1- The tension btw the two XS sets is released using a single reaction as nuisance

2- Adding more XS as nuisance does not increase further the error bars. ->Data systematics mitigate the uncertainties from XS

3- NSS method gives a little bit more freedom so we use it.

Methodology -> 1-Covariance matrix for data uncertainties

Errors are dominated by systematics

CRD6f : See Laurent Derome talk in a bit !

-> 2-Theoretical errors are handled with *nuisance* parameters Solar modulation: force field approximation

A. Ghelfi et al A&A 591, A94 (2016)

Production cross section: NSS nuisance method only on $\sigma_{^{12}C\rightarrow^{11}B}$

-> 3-Iterative fitting procedure using C and O AMSO2 data

Two reasons : - To be consistent with primary AMSO2 data - To better constrain the high-rigidity break

ICRC -- 29/07/19

II - Subtleties of the fitting procedure

Excellent fit to C and O AMSO2 data ! Injection is a pure power law of the rigidity

re handled with *nuisance* parameters e field approximation

: NSS nuisance method only on $\sigma_{^{12}\mathrm{C}
ightarrow^{11}\mathrm{B}}$

edure using C, and O AMSO2 data istent with primary AMSO2 data constraint the high-rigidity break

II - Subtleties of the fitting procedure

Illustration : uncertainty on the diffusion coefficient.

Conclusions

RESULTS:

- -> Kraichnan like delta
- -> High-rigidity break confirmed in the diffusion coefficient Y.G et al PRL 119, 241101 (2017)
- -> Hint for a low-rigidty break in diffusion @~4GV
- -> Primary injection is compatible with a simple rigidity power law

BIG, SLIM and, QUAINT : New up-to-date transport benchmark parameters

-> Already used for antiprotons Boudaud et al: arxiv 1906.07119

CRD1b: See Mathieu Boudaud talk last Thursday !

-> Also used to forecast expected data slopes in AMSO2 data

CRD6g: See Manuela Vecchi talk in a bit !

-> Dictionary provided to go from 1D to 2D model (useful for dark matter-related studies)

Present analysis: B/C data only.

-> Data available: Li, Be, B, C, N, O, possibly 3,4He and heavier nuclei soon.

PROSPECTS:

CRD6b: See Alberto Oliva talk in a bit!

- -> Use other secondary-to-primary species to check consistency and tighten the constraints on transport parameters.
- -> Use radioactive species to constrain halo size of the Galaxy (necessary for dark matter studies).
- -> Forthcoming interface of USINE with Python will give us a better control to deal with more global studies.

KEY INGREDIENTS to further improve all analyses:

- -> Experimental covariance from the AMSO2 collaboration.
- -> Reduce the uncertainties on spallation cross sections.

CRI6e: See Michael Unger talk on Saturday!
