Dark-matter signals at neutrino telescopes

Dark-matter candidate particle is searched with complementary methods

Indirect searches

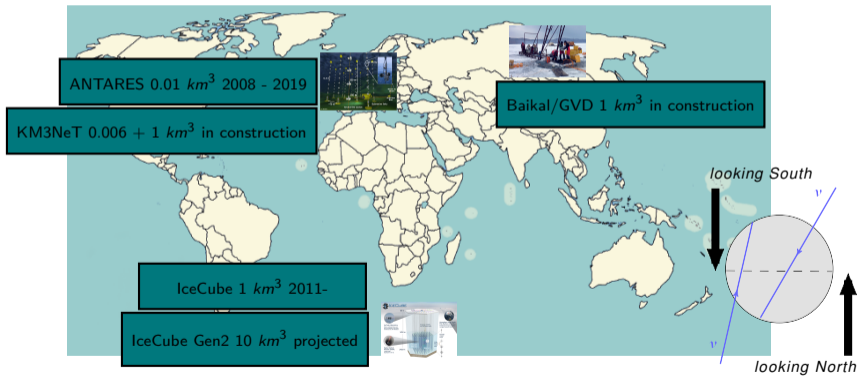

- 1 look into potential dark-matter sources in astrophysical environment: typically Dwarf Spheroidal Galaxies, Galaxy Clusters, Galactic Centre, Sun, Earth
- 2 aim at measuring Standard Model products of annihilation or decay
- 3 contain large uncertainties and many parameters

Signal is elusive! Cross-analysis is required to go for an **unambiguous identification**.

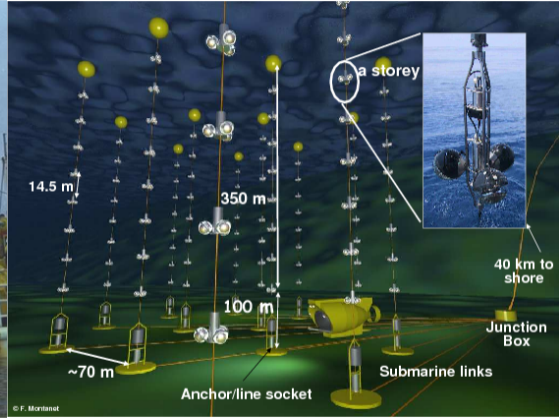

Combined efforts necessary to push **limits** to new regions of the parameters space

Neutrinos as dark-matter messengers

- 1 Reduce the problem of *source confusion* in regions like the Centre of the Milky Way
- 2 Need no dedicated data set!

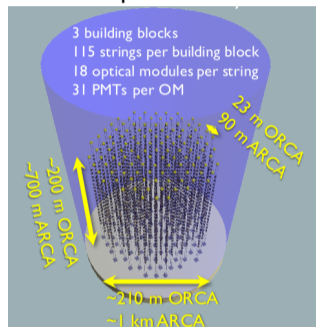

The ANTARES neutrino detector

40 km offshore Toulon, 12 lines, 885 PMTs, 2500 m depth, more than 12 years of operations

The KM3NeT neutrino detector

Currently being deployed in French and Italian sites with phased installation scheme

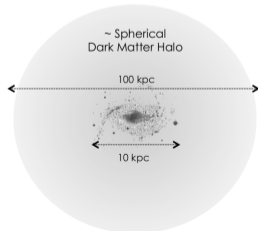

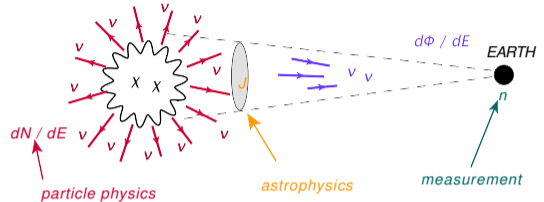

- 1 ORCA: 1 small, dense block for oscillations and mass hierarchy with atmospheric ν
- 2 ARCA: 2 large, sparse blocks for astrophysics

Both suitable for dark-matter searches (being candidate particle mass fairly unconstrained)

ANTARES: Galactic Centre

Favourable source: (1) largest dark-matter density and (2) in the Southern Hemisphere

$$\Phi = \frac{n}{\mathcal{A}(M_\chi) t} = \frac{1}{4\pi} \frac{1}{M_\chi^2} \frac{\langle \sigma v \rangle}{2} \int_0^M \frac{dN}{dE} dE J$$

flux = number of events observed / acceptance * lifetime =
annihilation rate¹ * average number of particles per collision *
source geometry

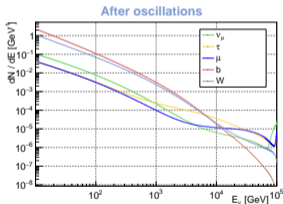

¹ in the above formula: for Majorana self-conjugated WIMPs

Search input and setup

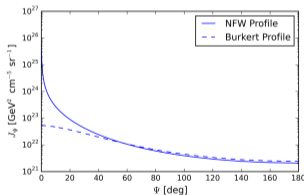

Data set: 11 years (3170 days lifetime), two algorithms for track (ν_μ CC) reconstruction.

Dark-matter **signal** is reproduced with PPPC4[1] and different models for J-Factor[2] as a cluster of events around the source position, searched for with *unbinned likelihood method*.

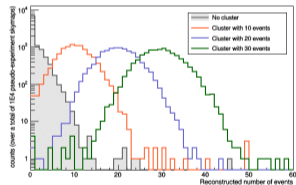

$$\log \mathcal{L}(n_s) = \sum_{i=1}^N \log \left[n_s \mathbf{S}(\psi_i, N_{\text{HITS}}^i) + n_{bg} \mathbf{B}(\delta_i, N_{\text{HITS}}^i) \right] - n_{bg} - n_s$$

Energy distribution

Morphology

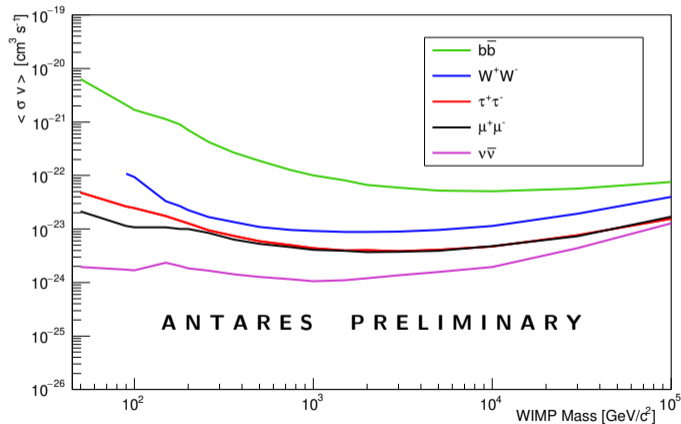

Pseudo-experiments

Background is described with right-ascension shuffled (*blind*) data

[1] <http://www.marcocirelli.net/PPPC4DMID.html> [2] Burkert [ApJ 1995], NFW [ApJ 1996], McMillan [MNRAS 2017]

Unblinding results

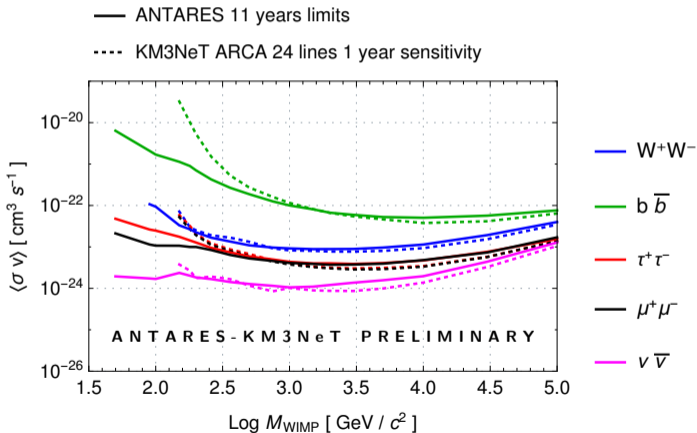

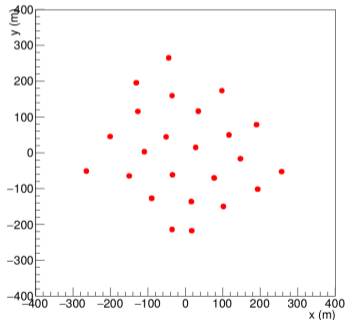

The test statistic for 11 years of ANTARES data is compatible with background

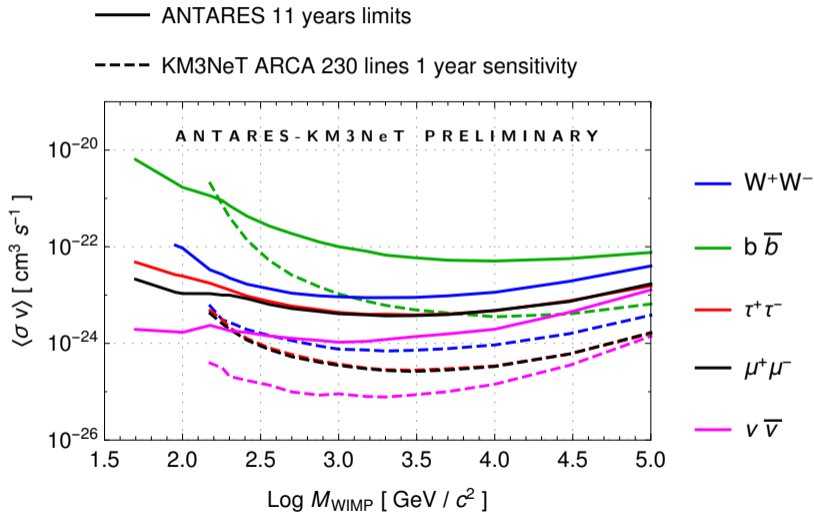

Upper limits on $\nu_\mu + \bar{\nu}_\mu$ flux at 90% CL are converted into limits on the thermally averaged annihilation cross section for WIMP pair annihilation $\langle \sigma v \rangle$, for five channels inspected.

Sensitivities of KM3NeT-ARCA for the Galactic Centre

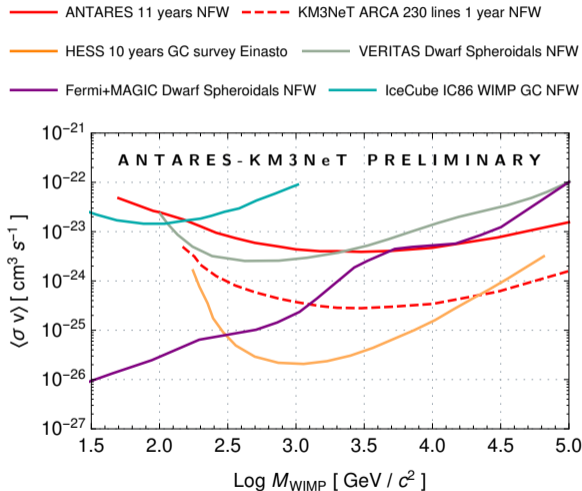

Preliminary study done with a first installation phase of ARCA (24 lines). With 1 year of lifetime, similar level to current ANTARES limits can be reached.

Sensitivities of KM3NeT-ARCA for the Galactic Centre

Summary of Galactic Centre results

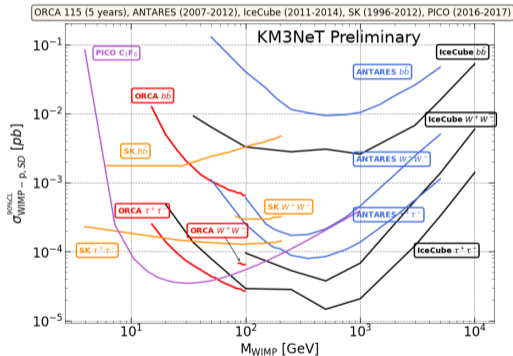

Searches towards the Sun

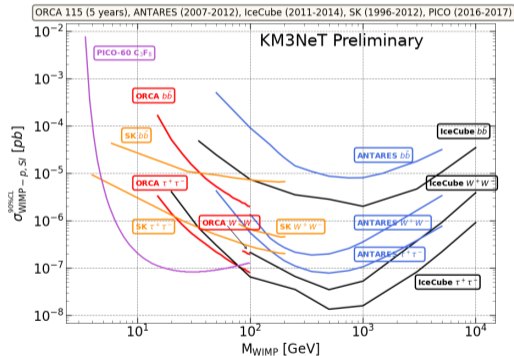

- Sensitive to **DM-nucleon scattering cross-section**, spin-dependent and spin-independent
- Differential neutrino flux is related with the annihilation rate $\frac{d\Phi}{dE_\nu} = \frac{\Gamma}{4\pi d^2} \frac{dN_\nu}{dE_\nu}$
- In equilibrium between capture and annihilation $\Gamma = C/2$ with C capture rate
- **Very clean: if signal \rightarrow direct interpretation** (astrophysical background well known)
- Less affected by halo uncertainties (point-like extension)
- Signal from moving source: bias-free
- Searches with neutrino telescopes are sensitive at **low velocities** (= easier capture)

Searches towards the Sun with KM3NeT-ORCA: sensitivities

WIMP-proton scattering cross-section. Red lines are 5 years of ORCA simulated data. For analysis details see PoS(ICRC2019)536 and poster by D. Lopez-Coto and S. Navas

Spin-dependent

Spin-Independent

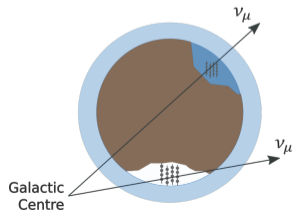

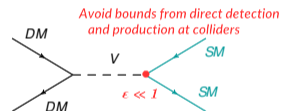

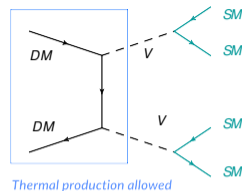

Other dark-matter analyses

Heavy sectors can provide DM candidates beyond the TeV scale.
Extension to high-energy searches with *secluded* DM scenarios:

- evade unitarity bound (\Rightarrow limits on DM mass) with a modified cosmology implying a change of freeze-out point [3]
- DM is secluded from SM particles by new on-shell mediator

For details see PoS(ICRC2019)519 and poster by S.R. Gozzini, F. Sala, C. Lagunas and J. Zornoza

[3] M. Cirelli, Y. Gouttenoire, K. Petraki, F. Sala, JCAP, 2019

Combined DM search with ANTARES and IceCube, in a range between 50 GeV and 1 TeV where sensitivities are comparable.
For details see PoS(ICRC2019)552 and talk by N. Iovine.

Summary of ANTARES and KM3NeT dark-matter searches

Results with ANTARES and KM3NeT on WIMP pair annihilation

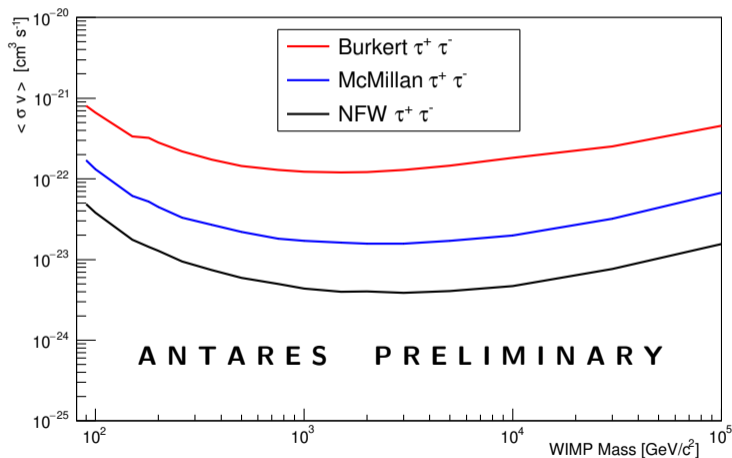

- **Galactic Centre: 11 years of ANTARES data unblinded**, compatible with background.
- **KM3NeT-ARCA 24 lines** will reach down to current ANTARES limits for the GC with 1 year of operation. Noticeable improvement with **KM3NeT-ARCA 230 lines**.
- Sensitivities for **KM3NeT-ORCA for WIMP pair annihilation in the Sun**
[see PoS(ICRC2019)536] by D. Lopez-Coto and S. Navas.

Other analyses involving ANTARES and KM3NeT

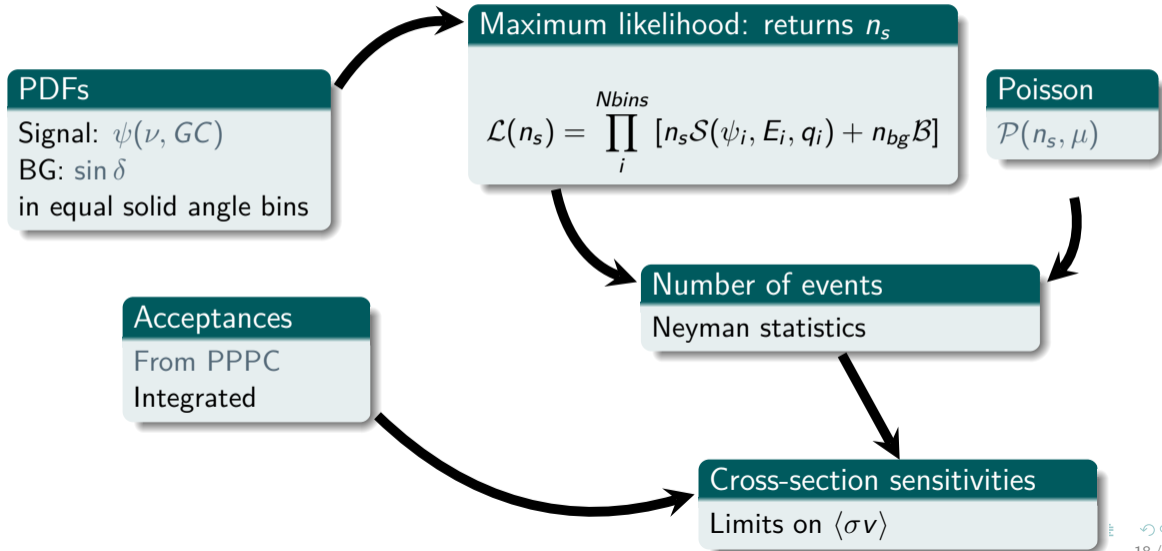

- Test of new scenarios: **secluded dark matter** in heavy WIMP models with ANTARES
[see PoS(ICRC2019)519] by F. Sala, S.R. Gozzini, C. Lagunas and J. Zornoza.
- **Combined searches** involving ANTARES and IceCube joint analysis
[see PoS(ICRC2019)552] by N. Iovine, S.R. Gozzini, J.A. Aguilar, S. Baur and J. Zornoza.
