ANTARES and IceCube Combined Search for Neutrino Point-like and Extended Sources in the Southern Hemisphere

Giulia Illuminati on behalf of the ANTARES and IceCube Collaborations

ICRC2019 - 27/07/2019 – Madison
The ANTARES and IceCube detectors

Mediterranean Sea Northern Hemisphere between 2010 and 2470 m deep
12 lines, 885 PMTs
~0.01 km³

Antarctic Ice South Pole between 1450 and 2450 m deep
86 lines, over 5000 PMTs
~1 km³

Complementarity for the Southern sky

Good visibility of the Southern sky for energies < 100 TeV

High statistics
## Data samples

### ANTARES 9 years: tracks and shower

<table>
<thead>
<tr>
<th>Sample</th>
<th>Livetime (days)</th>
<th># of events</th>
</tr>
</thead>
<tbody>
<tr>

Samples relative efficiency for detecting events from potential sources

Consequence of the different layouts, locations of the telescopes and selection techniques in the Southern sky

Mainly depends on source spectrum and declination
Search method: Likelihood

\[ L(n_S, \gamma, \delta, \alpha_S) = \prod_{j=1}^{7} \prod_{i=1}^{N_j} \left[ \frac{n_s^j}{N_j} S^j_i(\gamma, \delta, \alpha_S) + \left(1 - \frac{n_s^j}{N_j}\right) B^j_i \right] \]

**Signal PDFs**

\[ S_i = S^{\text{space}} \cdot S^{\text{energy}} \]

**Background PDFs**

\[ B_i = B^{\text{space}} \cdot B^{\text{energy}} \]

test statistic: 
\[ Q = \log L(\hat{n}_S, \hat{\gamma}, \hat{\delta}, \hat{\alpha}_S) - \log L(n_S = 0) \]
Combined $5\sigma$ discovery flux

\[ E_{\nu}^2 \phi_{\nu} dE_{\nu} \left[ \text{GeV cm}^{-2} \text{s}^{-1} \right] \]

\[ \sin \delta \]

\[ \delta \sin 1 - 0.8 - 0.6 - 0.4 - 0.2 - 0 \]

\[ E_{\nu}^{6-10} = 2.5 \gamma \text{discovery flux for } \sigma_{5} \]

\[ = 2.0 \gamma \text{discovery flux for } \sigma_{5} \]

Improvement of a factor $\sim 2$ in different regions of the Southern sky, depending on the energy spectrum of the source, compared to individual analyses
Search method: Strategies

Southern-sky search
• Investigated region: Southern sky
• TS evaluated in squares of $1^\circ \times 1^\circ$
• Free parameters: $n_s$, $\gamma$, $\delta_s$, $\alpha_s$
• Search for point-like and extended sources ($\sigma_s = 0.5^\circ$, $1.0^\circ$, $2.0^\circ$)

Galactic Center Region search
• Investigated region: ellipse, centred in the GC, $15^\circ$ semi-axis in galactic latitude, $20^\circ$ semi-axis in galactic longitude
• Same method as in the Southern-sky search
• Search for point-like and extended sources ($\sigma_s = 0.5^\circ$, $1.0^\circ$, $2.0^\circ$)

Candidate List search
• Investigated directions: 57 pre-selected source candidates
• All Southern sky candidates considered in the individual ANTARES and IceCube point-source analyses
• Galactic and extra-Galactic sources from TeVCat
• Free parameters: $n_s$, $\gamma$
Search method: Strategies

**Sagittarius A\***
- Dedicated search at the location of the SMBH
- Point-like and extended source ($\sigma_s = 0.5^\circ, 1.0^\circ, 2.0^\circ$) hypotheses tested
- Free parameters: $n_s, \gamma$

**RX J1713.7-3946**
- Dedicated search at the location of the SNR
- Gaussian extension of 0.6° for the emission profile (according to observations by HESS)
- Free parameters: $n_s$
- Two spectrum models:

\[
\begin{align*}
(1) \text{Vissani et al.}: & \quad \frac{dN}{dE_\gamma} = 0.89 \times 10^{-11} \left(\frac{E_\gamma}{\text{1 TeV}}\right)^{-2.06} \exp\left(-\frac{E_\gamma}{8.04 \text{ TeV}}\right) \text{TeV}^{-1} \text{cm}^{-2} \text{s}^{-1} \\
(2) \text{Kappes et al.}: & \quad \frac{dN}{dE_\gamma} = 1.55 \times 10^{-11} \left(\frac{E_\gamma}{\text{1 TeV}}\right)^{-1.72} \exp\left(-\sqrt{\frac{E_\gamma}{1.35 \text{ TeV}}}\right) \text{TeV}^{-1} \text{cm}^{-2} \text{s}^{-1}
\end{align*}
\]

Summary

- Various combined searches in the Southern sky with ANTARES and IceCube
- No significant point-like nor extended emission found, upper limits set
- Improvement up to a factor 2 achieved in the sensitivity to point sources compared to individual analyses

- Largest excess over the whole Southern sky: \((\alpha, \delta) = (213.2°, -40.8°)\), point-like source, 0.9σ post-trial
- Largest excess over the GC region: \((\alpha, \delta) = (274.1°, -40.1°)\), 2° source extension, 1.9σ post-trial
- Most significant source of the 57 investigates candidates: HESSJ1023-575, 0.2σ post-trial
- Most significant case for SMBH Sagittarius A*: point-like source, 6% p-value
- SNR RXJ 1713.7-3946: sensitivities and upper limits on the neutrino flux for two proposed emission models
