

High-energy neutrino flux from blazar flares

based on Oikonomou, Murase, Padovani, Resconi, Mészáros,
accepted for publication in MNRAS, arXiv:1906.05302

Foteini Oikonomou

July 25th-ICRC 2019

Which blazar flares produce the most neutrinos?

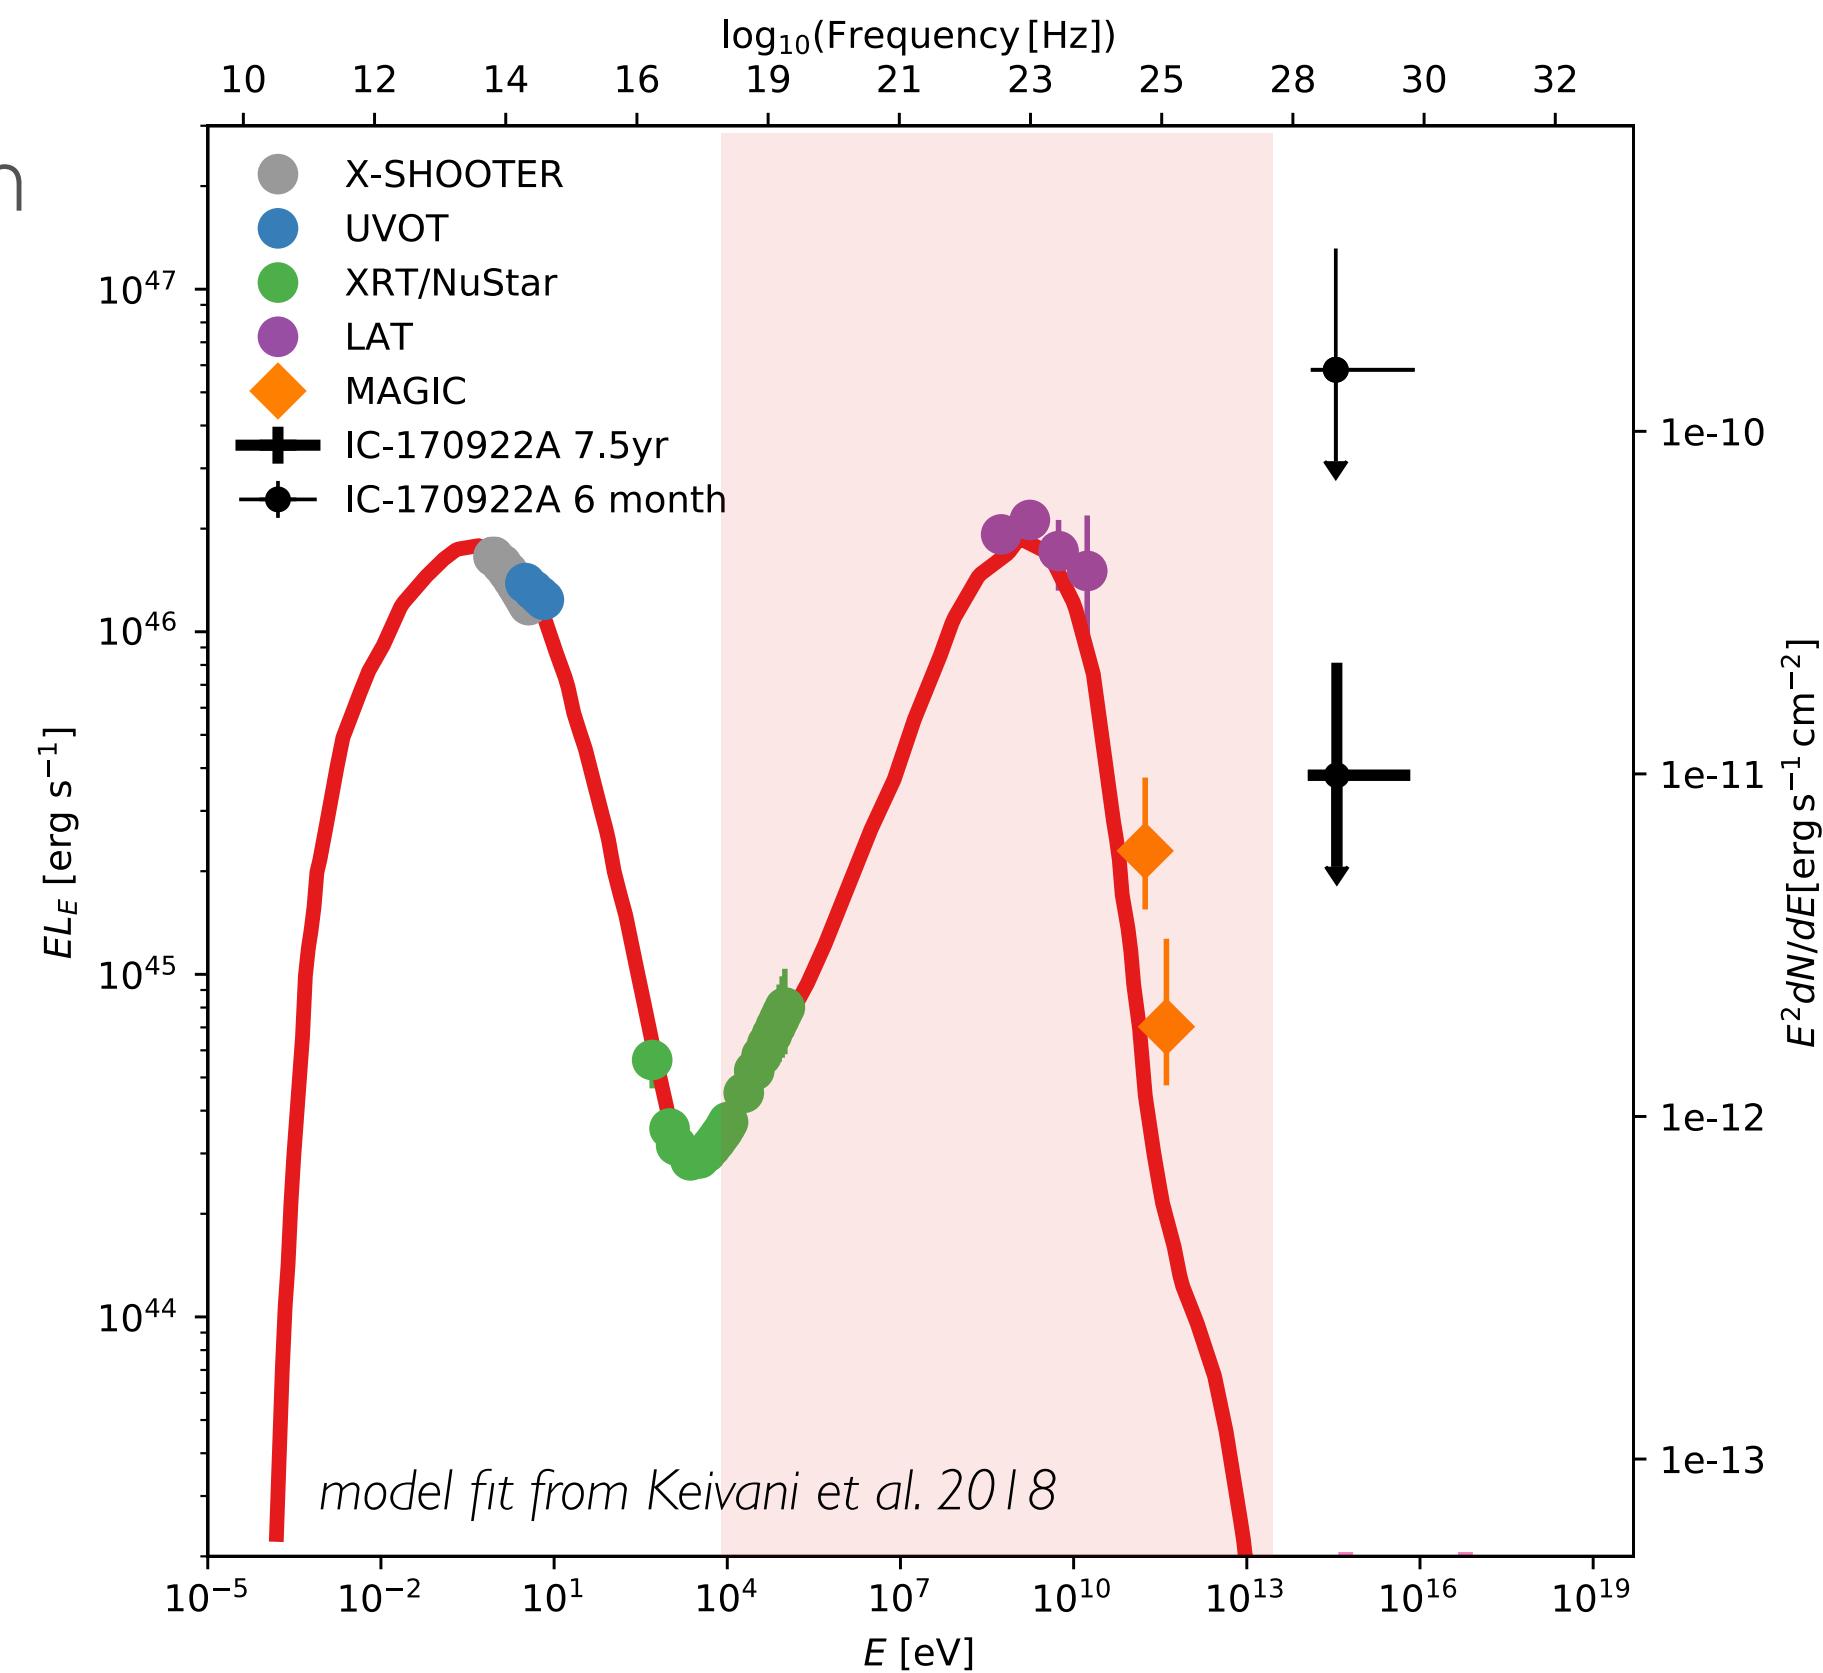

- Flares are ideal times for neutrino production and detection

Which blazar flares produce the most neutrinos?

- Flares are ideal times for neutrino production and detection
- Luminous, not too distant, long flares

Which blazar flares produce the most neutrinos?

- Flares are ideal times for neutrino production and detection
- Luminous, not too distant, long flares
- High Compton dominance

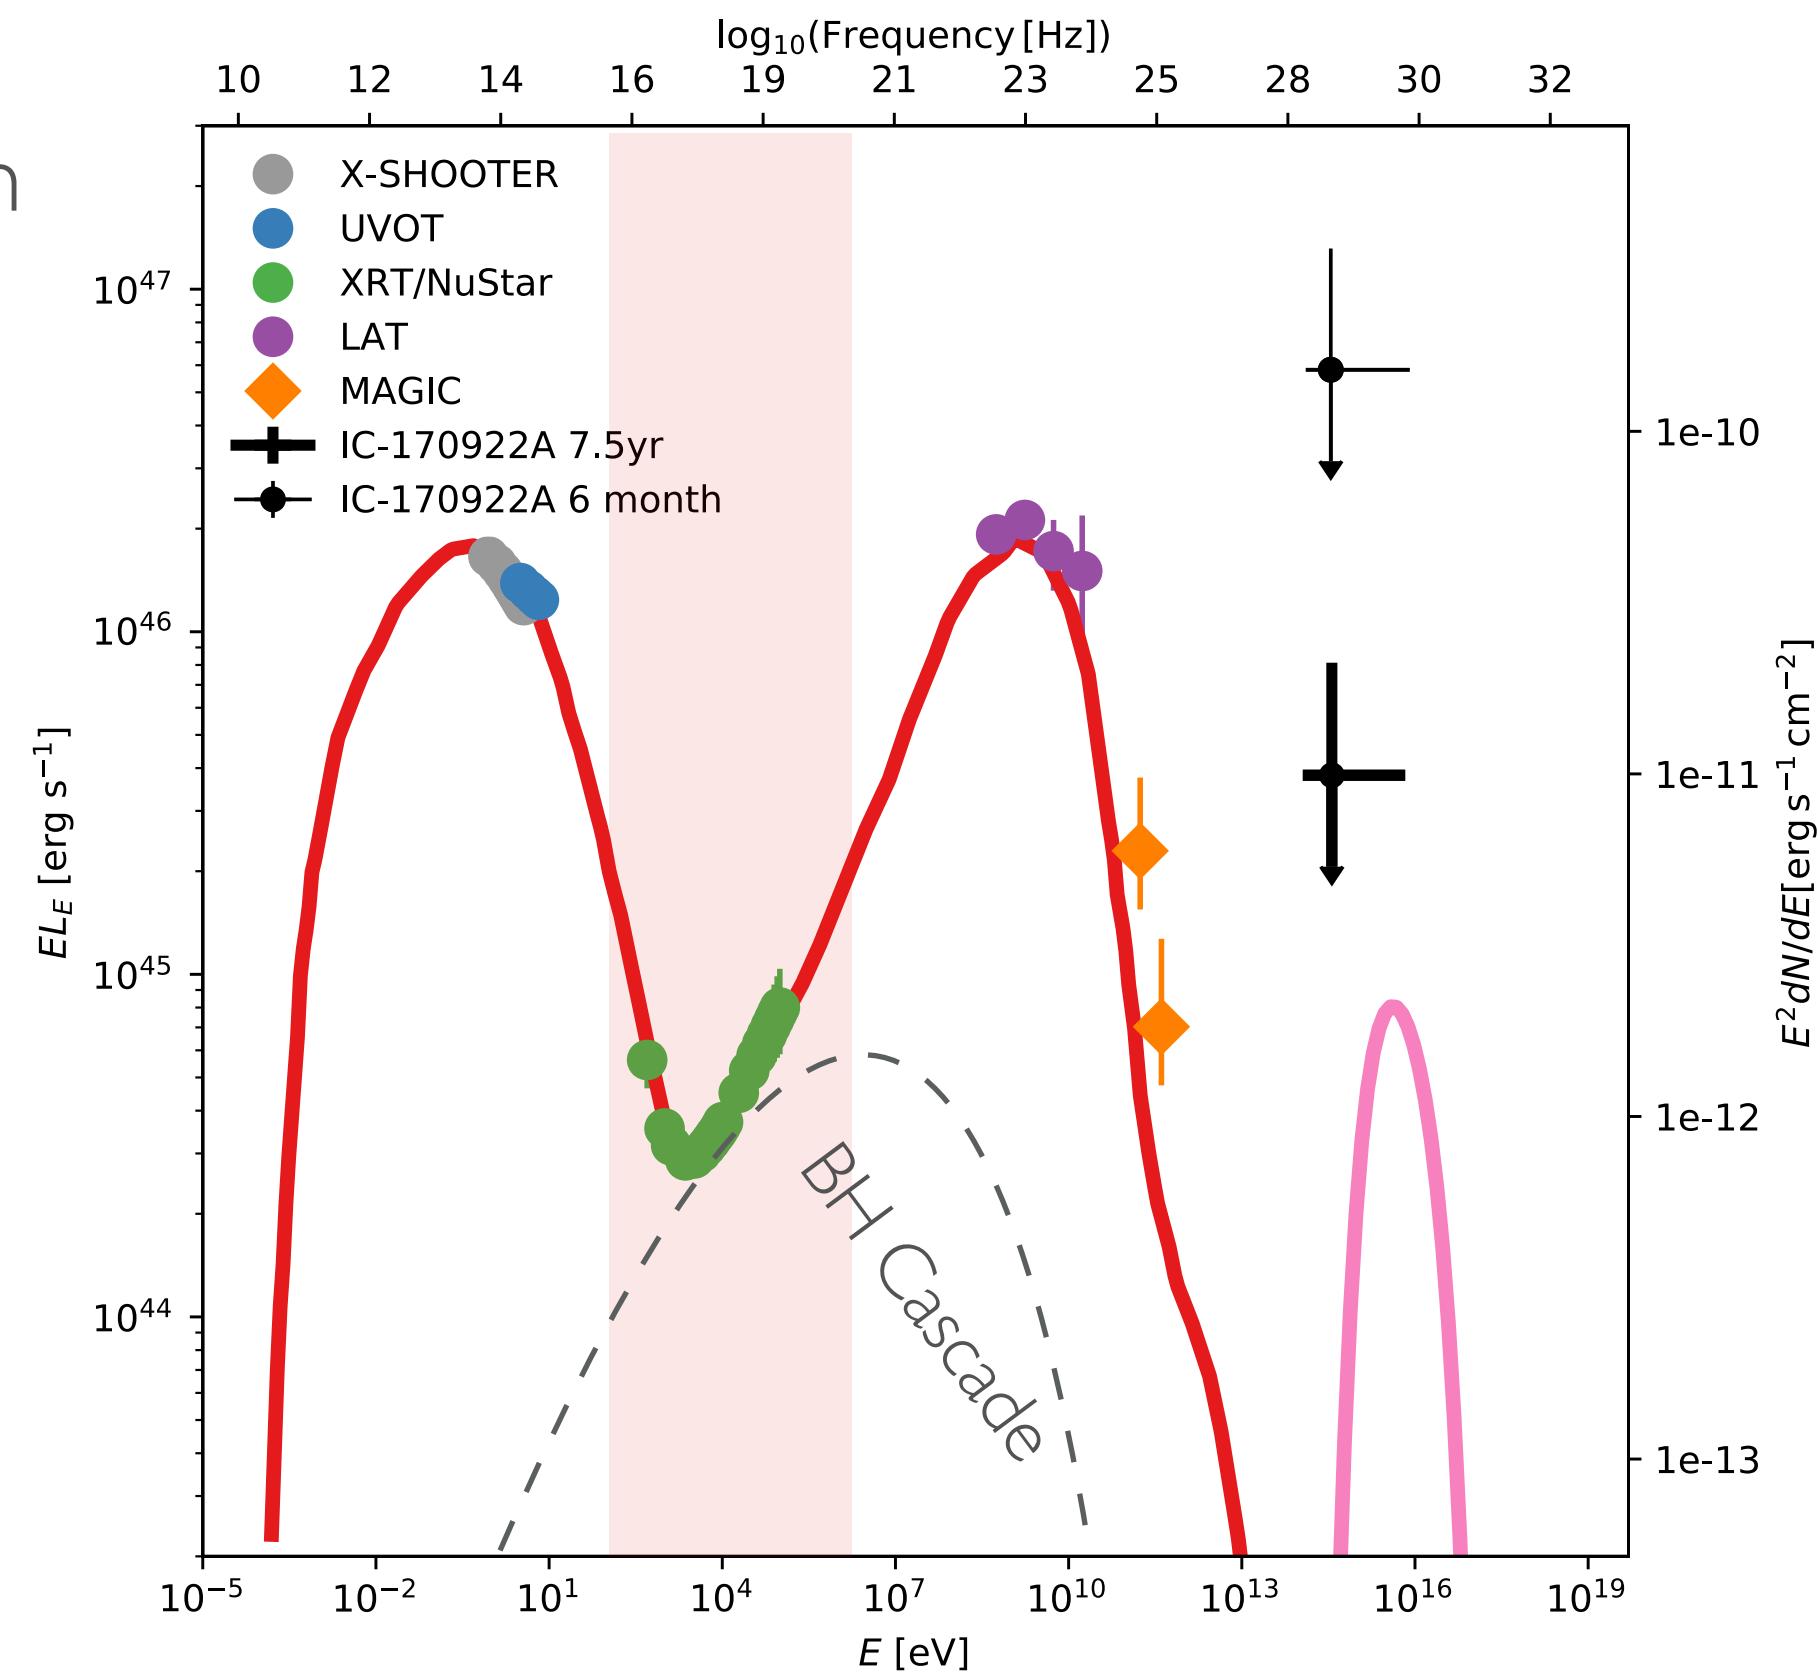

*TXS 0506+056 is not a BL Lac

Padovani, FO, Petropoulou, Giommi, Resconi, MNRAS, 484 L104, 2019

Which blazar flares produce the most neutrinos?

- Flares are ideal times for neutrino production and detection
- Luminous, not too distant, long flares
- High Compton dominance
- High X-ray cascade flux

Flare sample

Scenario A

Simple synchrotron self-Compton scenario
High maximum energy

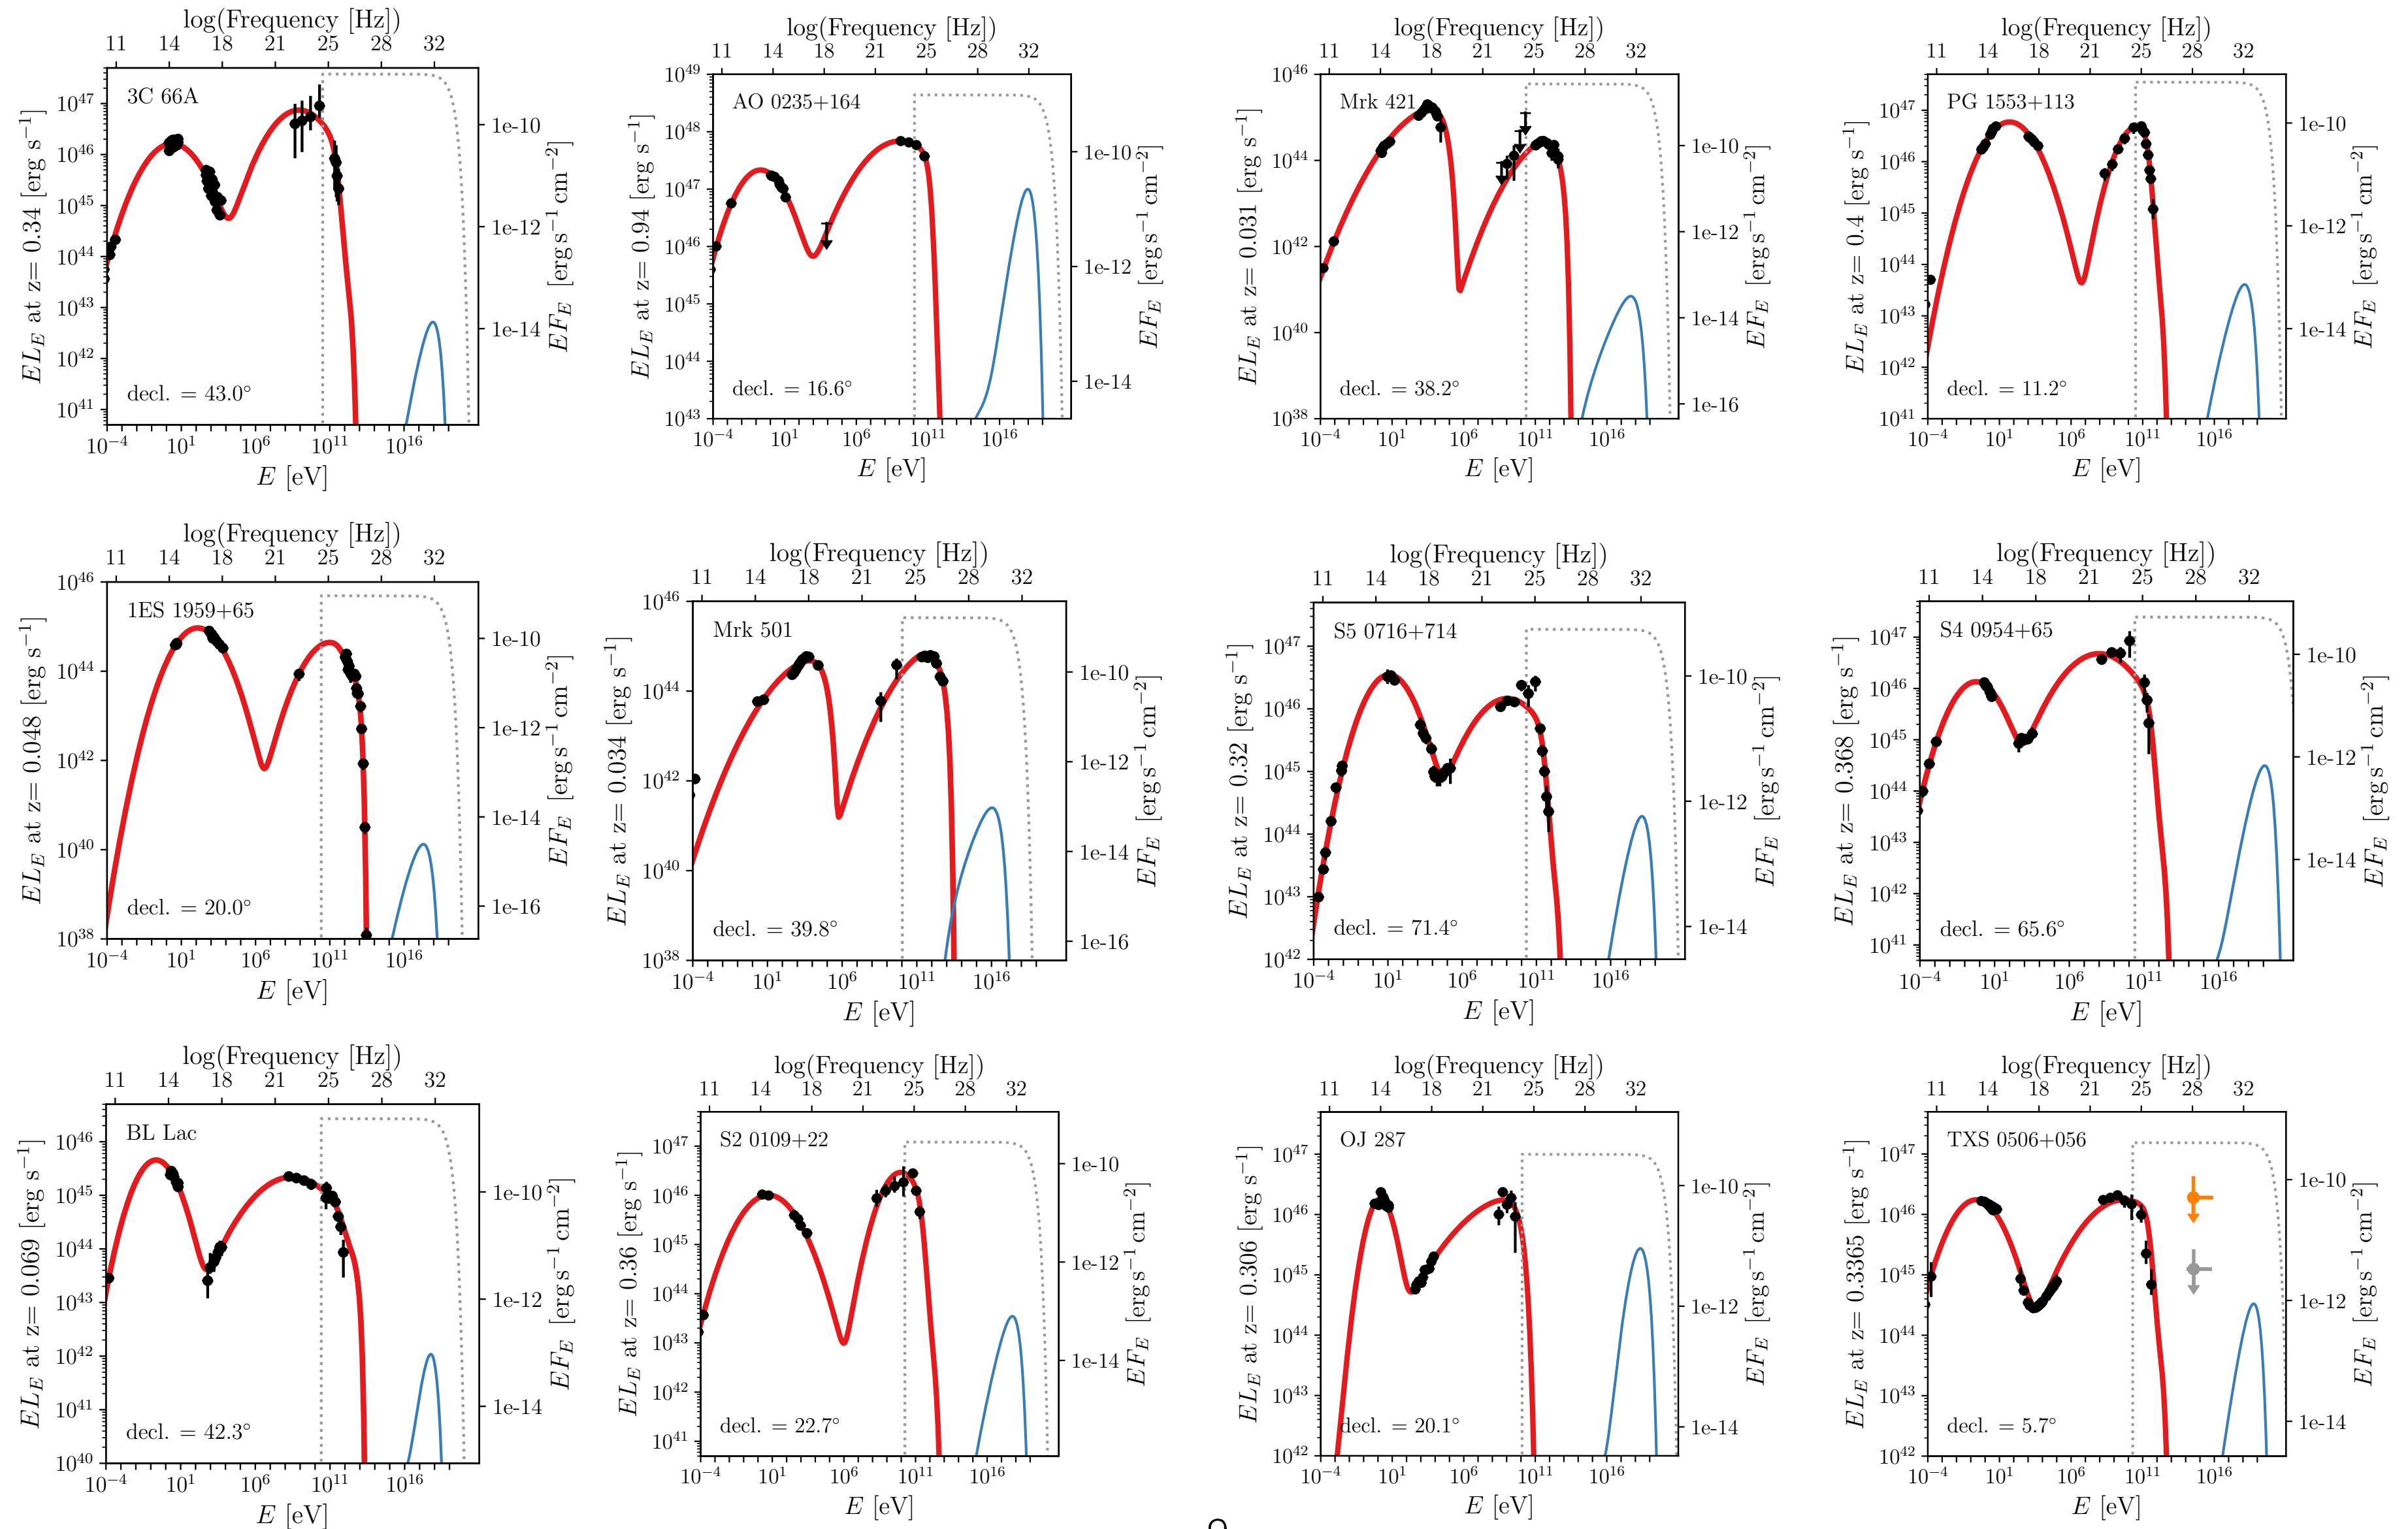

$$E_{\text{CR,max}} \sim \left(\frac{\eta}{1}\right) \left(\frac{B}{0.1 \text{ G}}\right) \left(\frac{R'}{10^{16} \text{ cm}}\right) \left(\frac{\Gamma}{25}\right) \sim 10^{19} \text{ eV}$$

Baryon loading = 10
(BL Lacs produce the observed UHECRs)

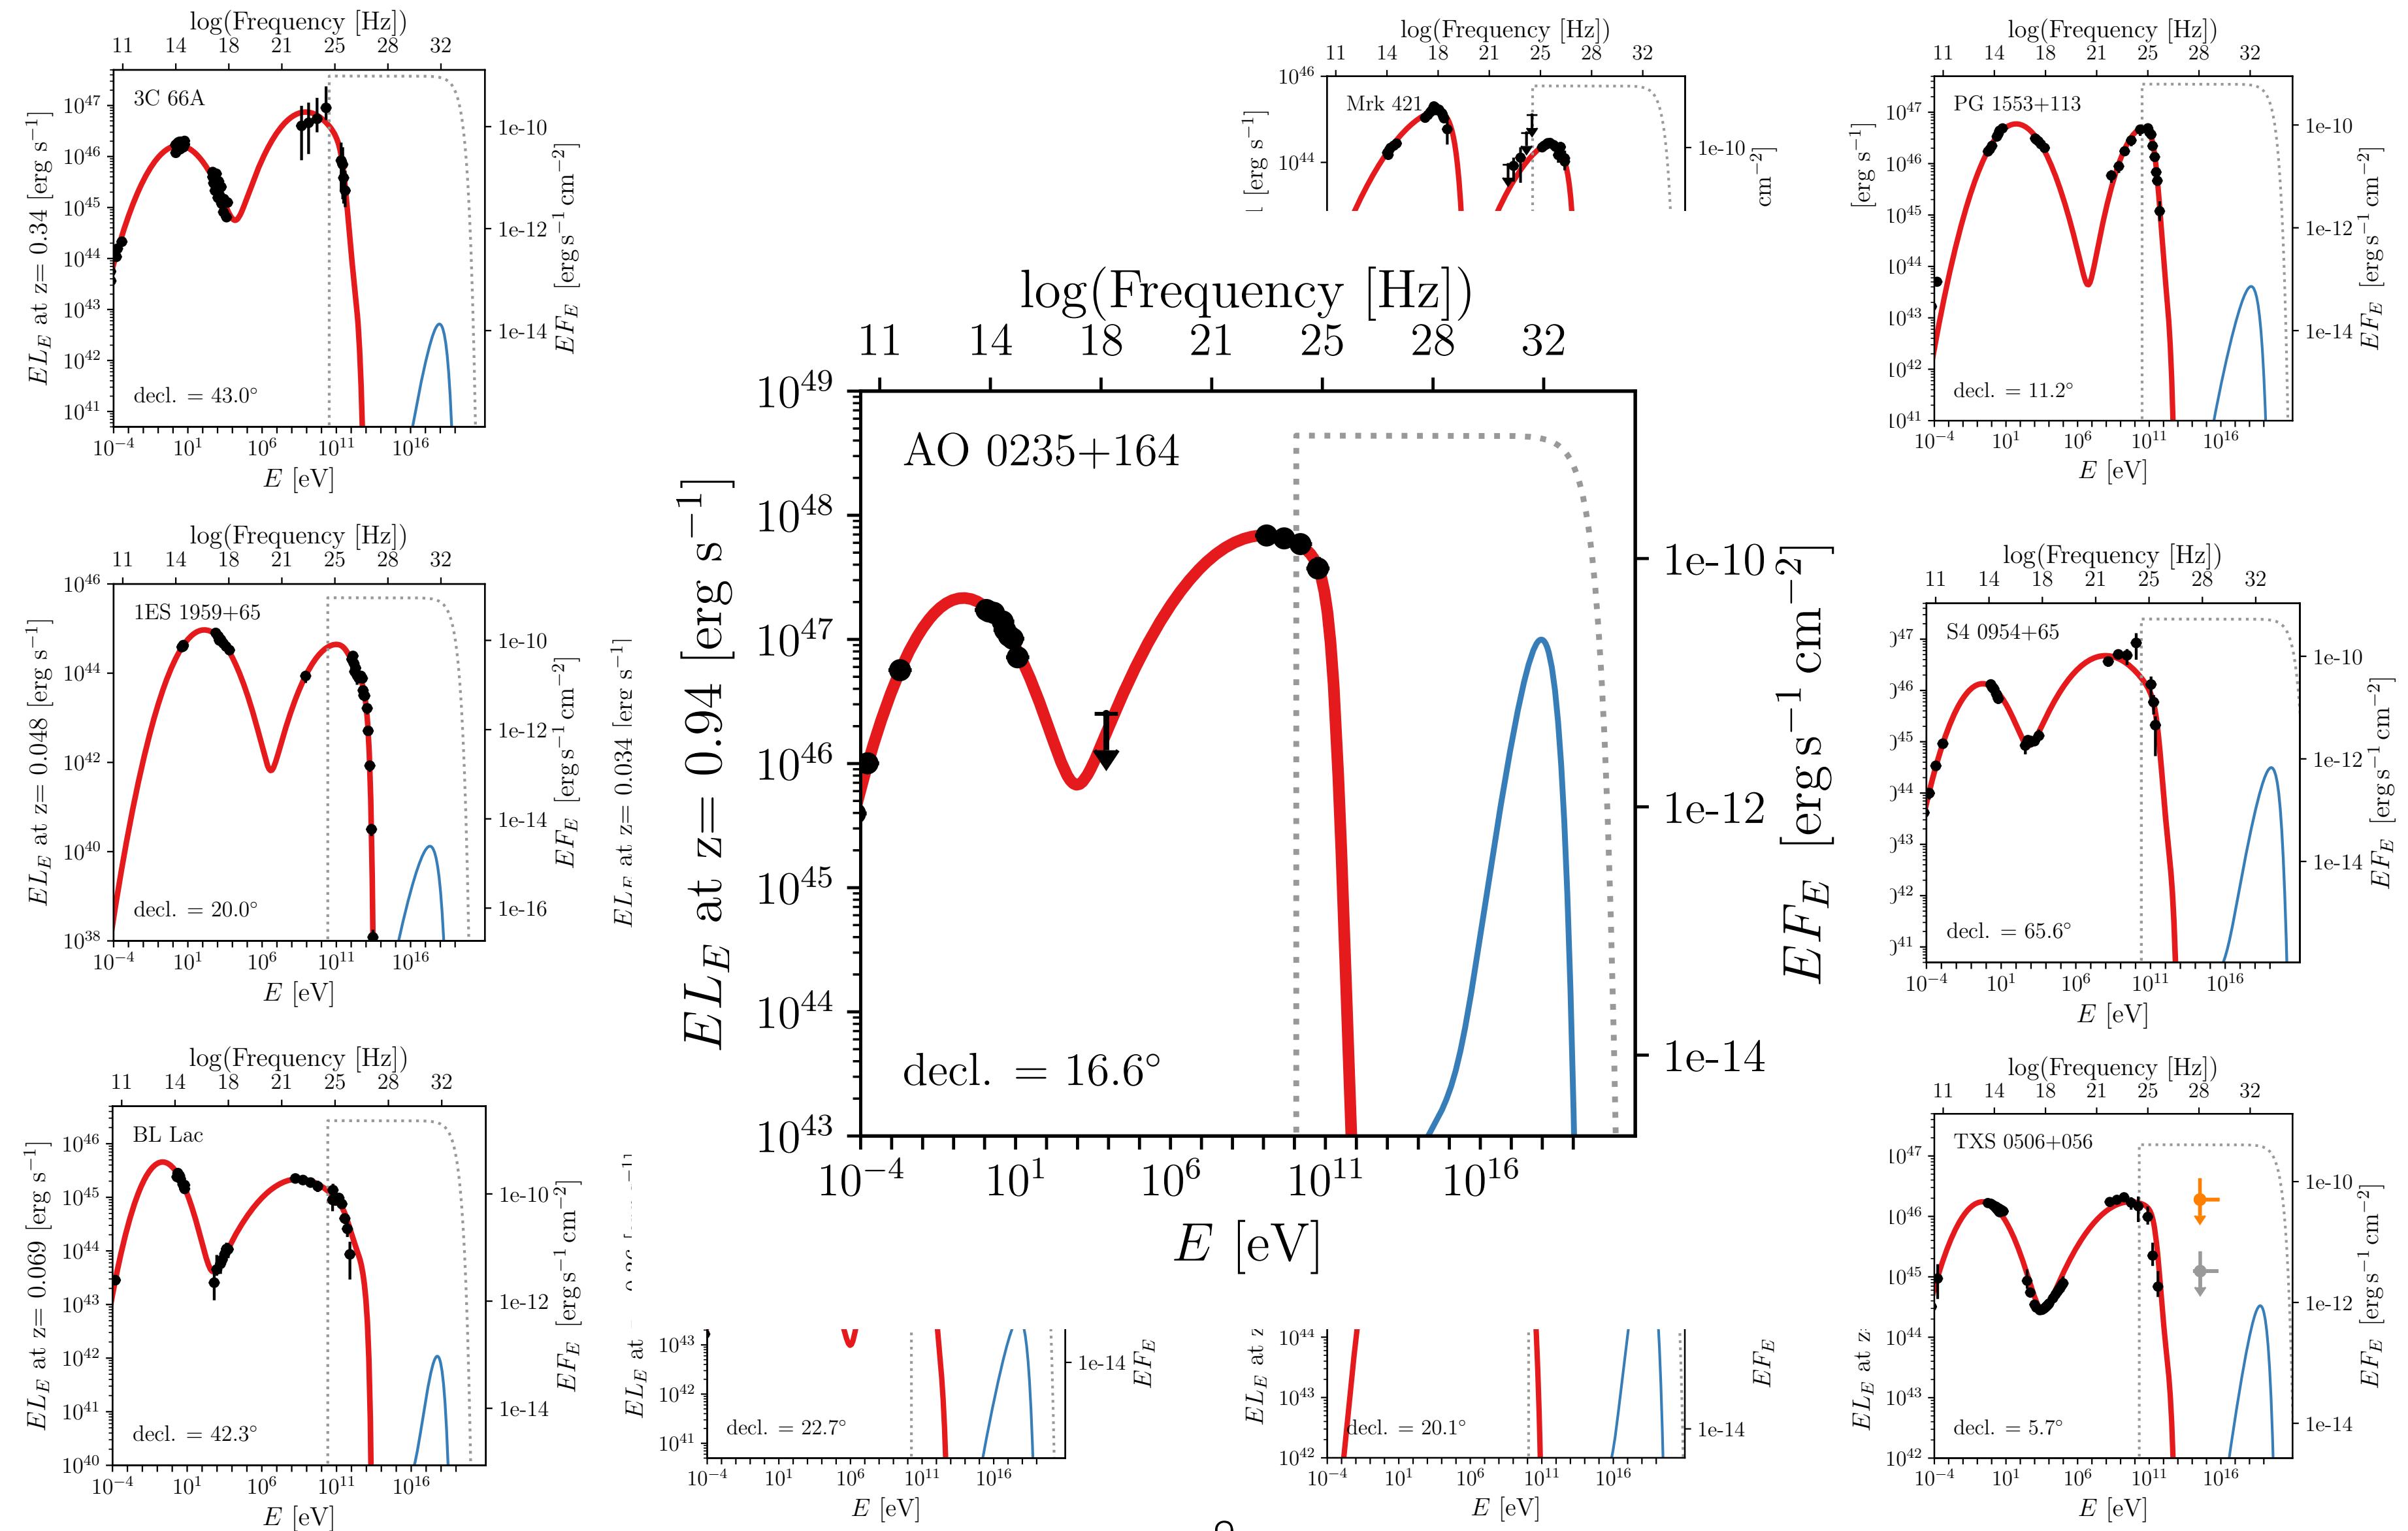

Scenario A

FO, Murase, Padovani, Resconi, Mészáros, MNRAS accepted,
arXiv:1906.05302

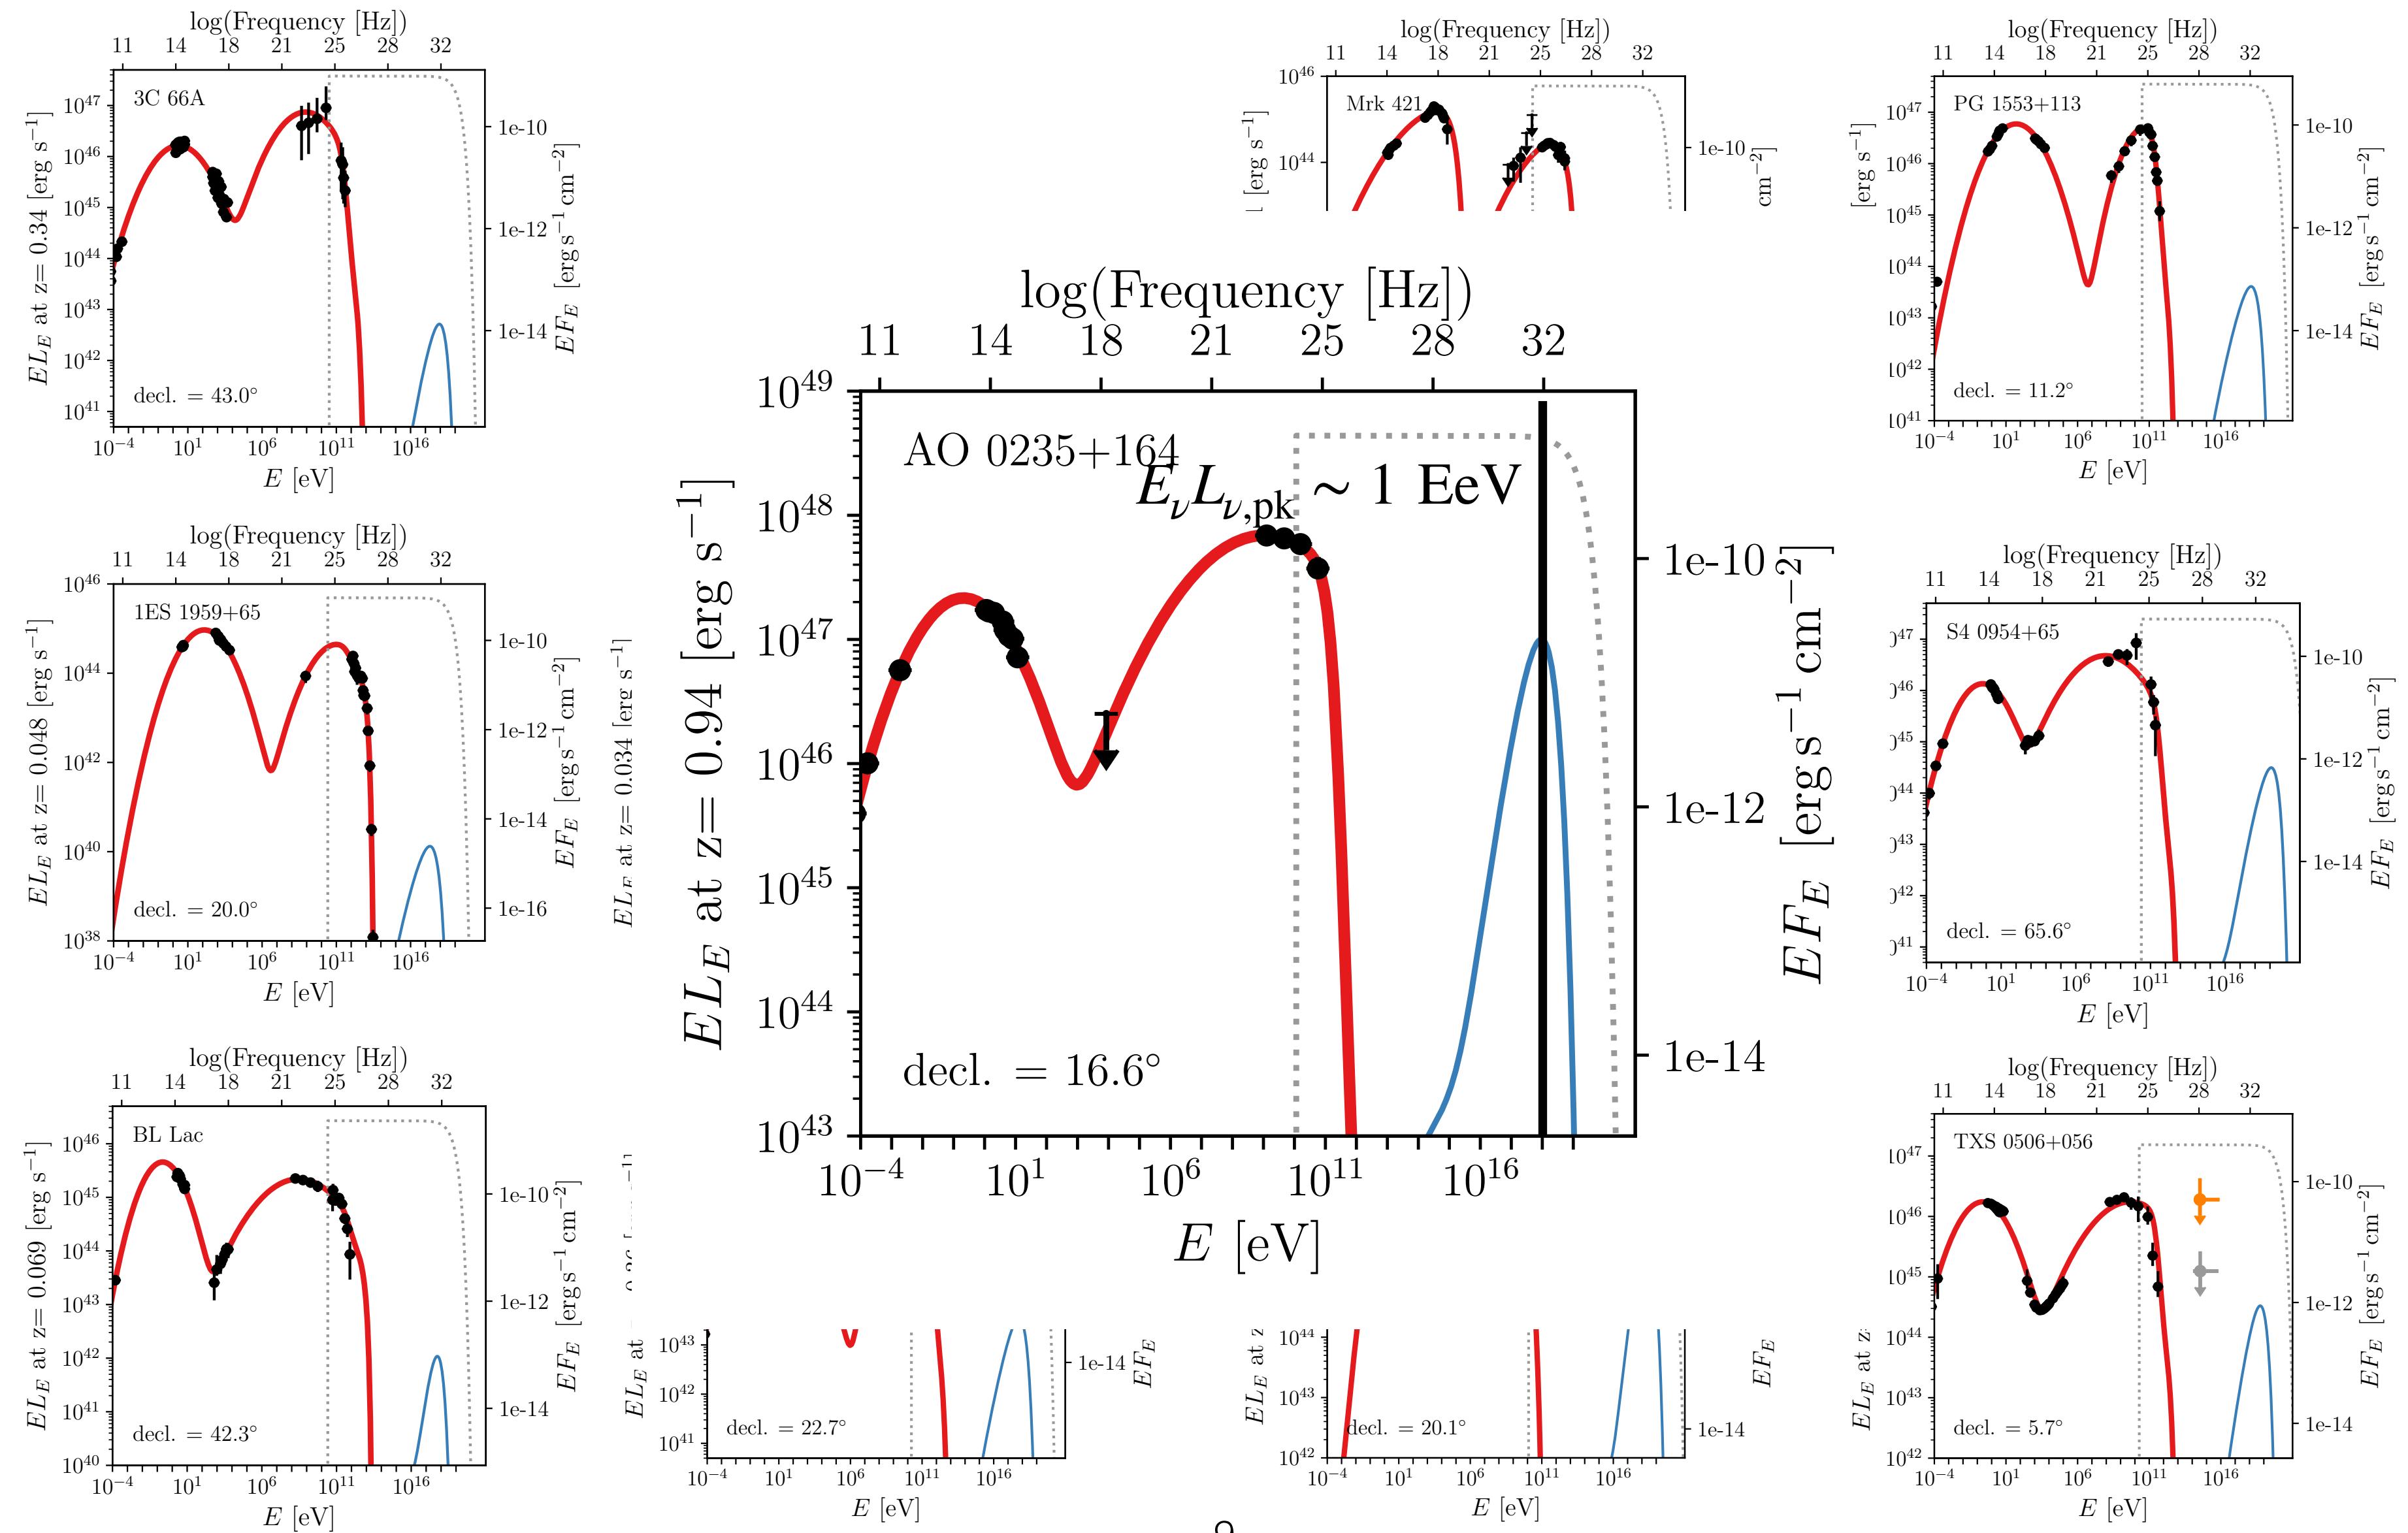

Scenario A

FO, Murase, Padovani, Resconi, Mészáros, MNRAS accepted,
arXiv:1906.05302

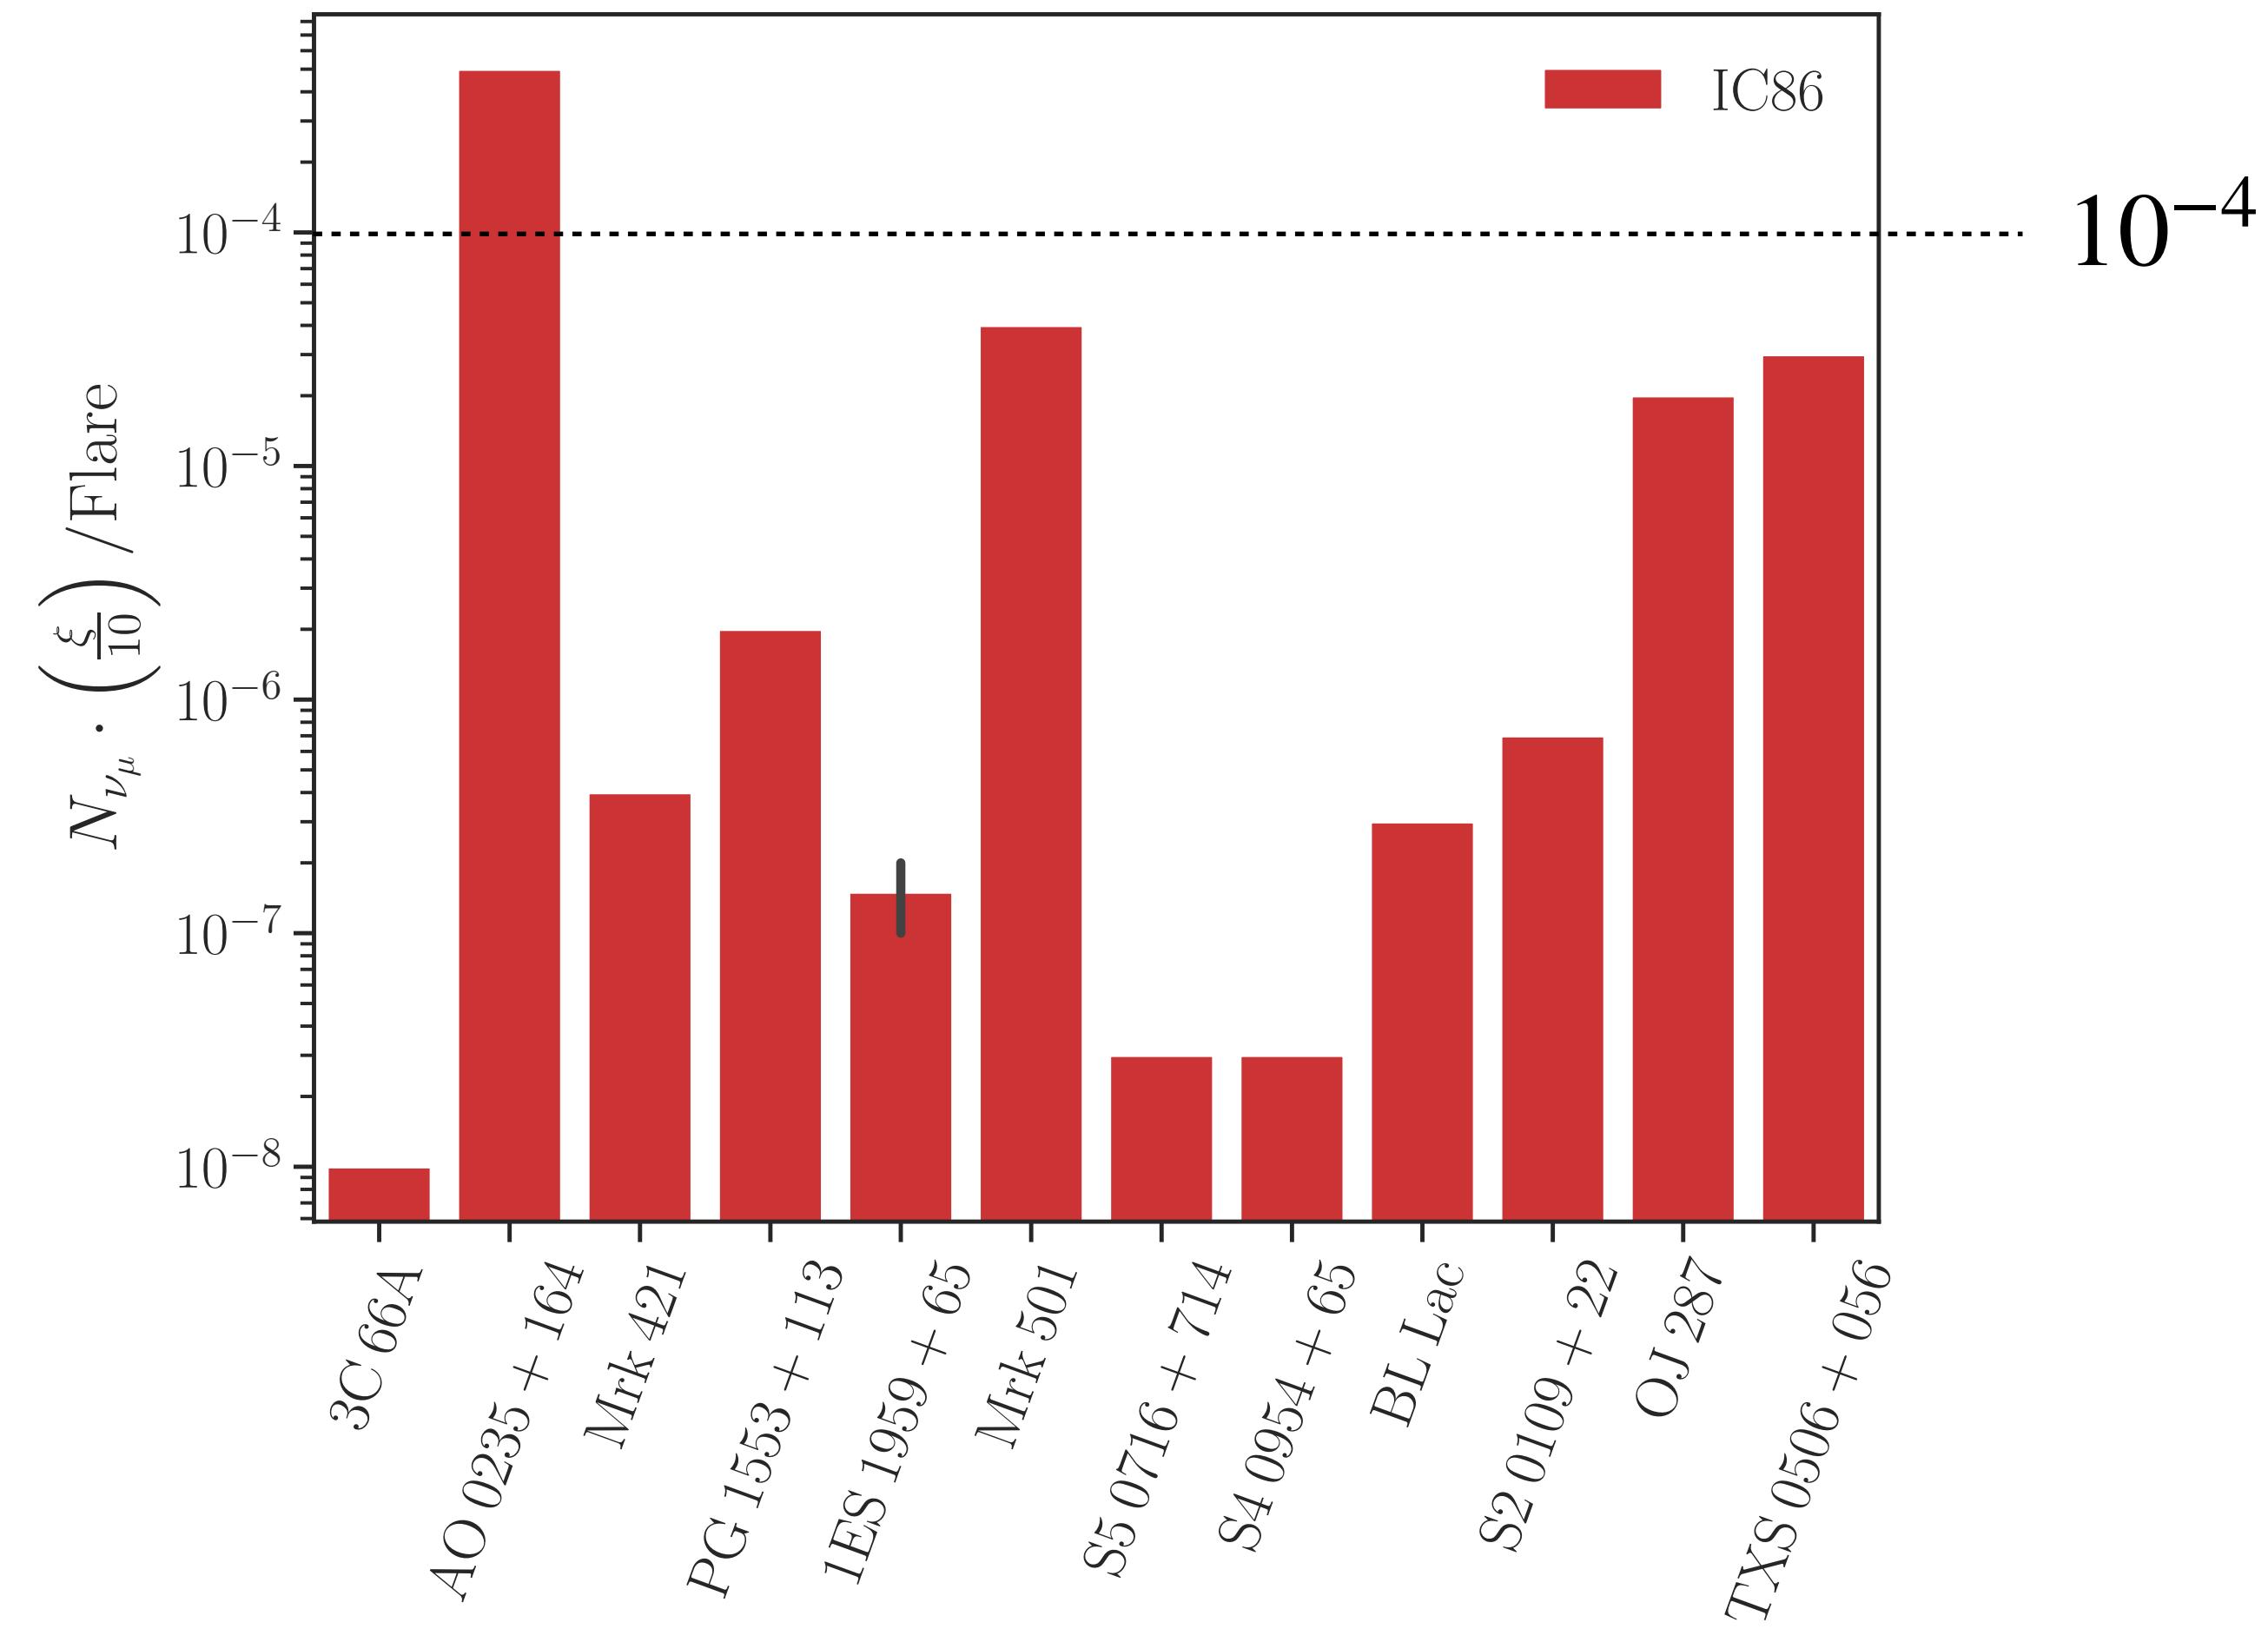

Scenario A

FO, Murase, Padovani, Resconi, Mészáros, MNRAS accepted,
arXiv:1906.05302

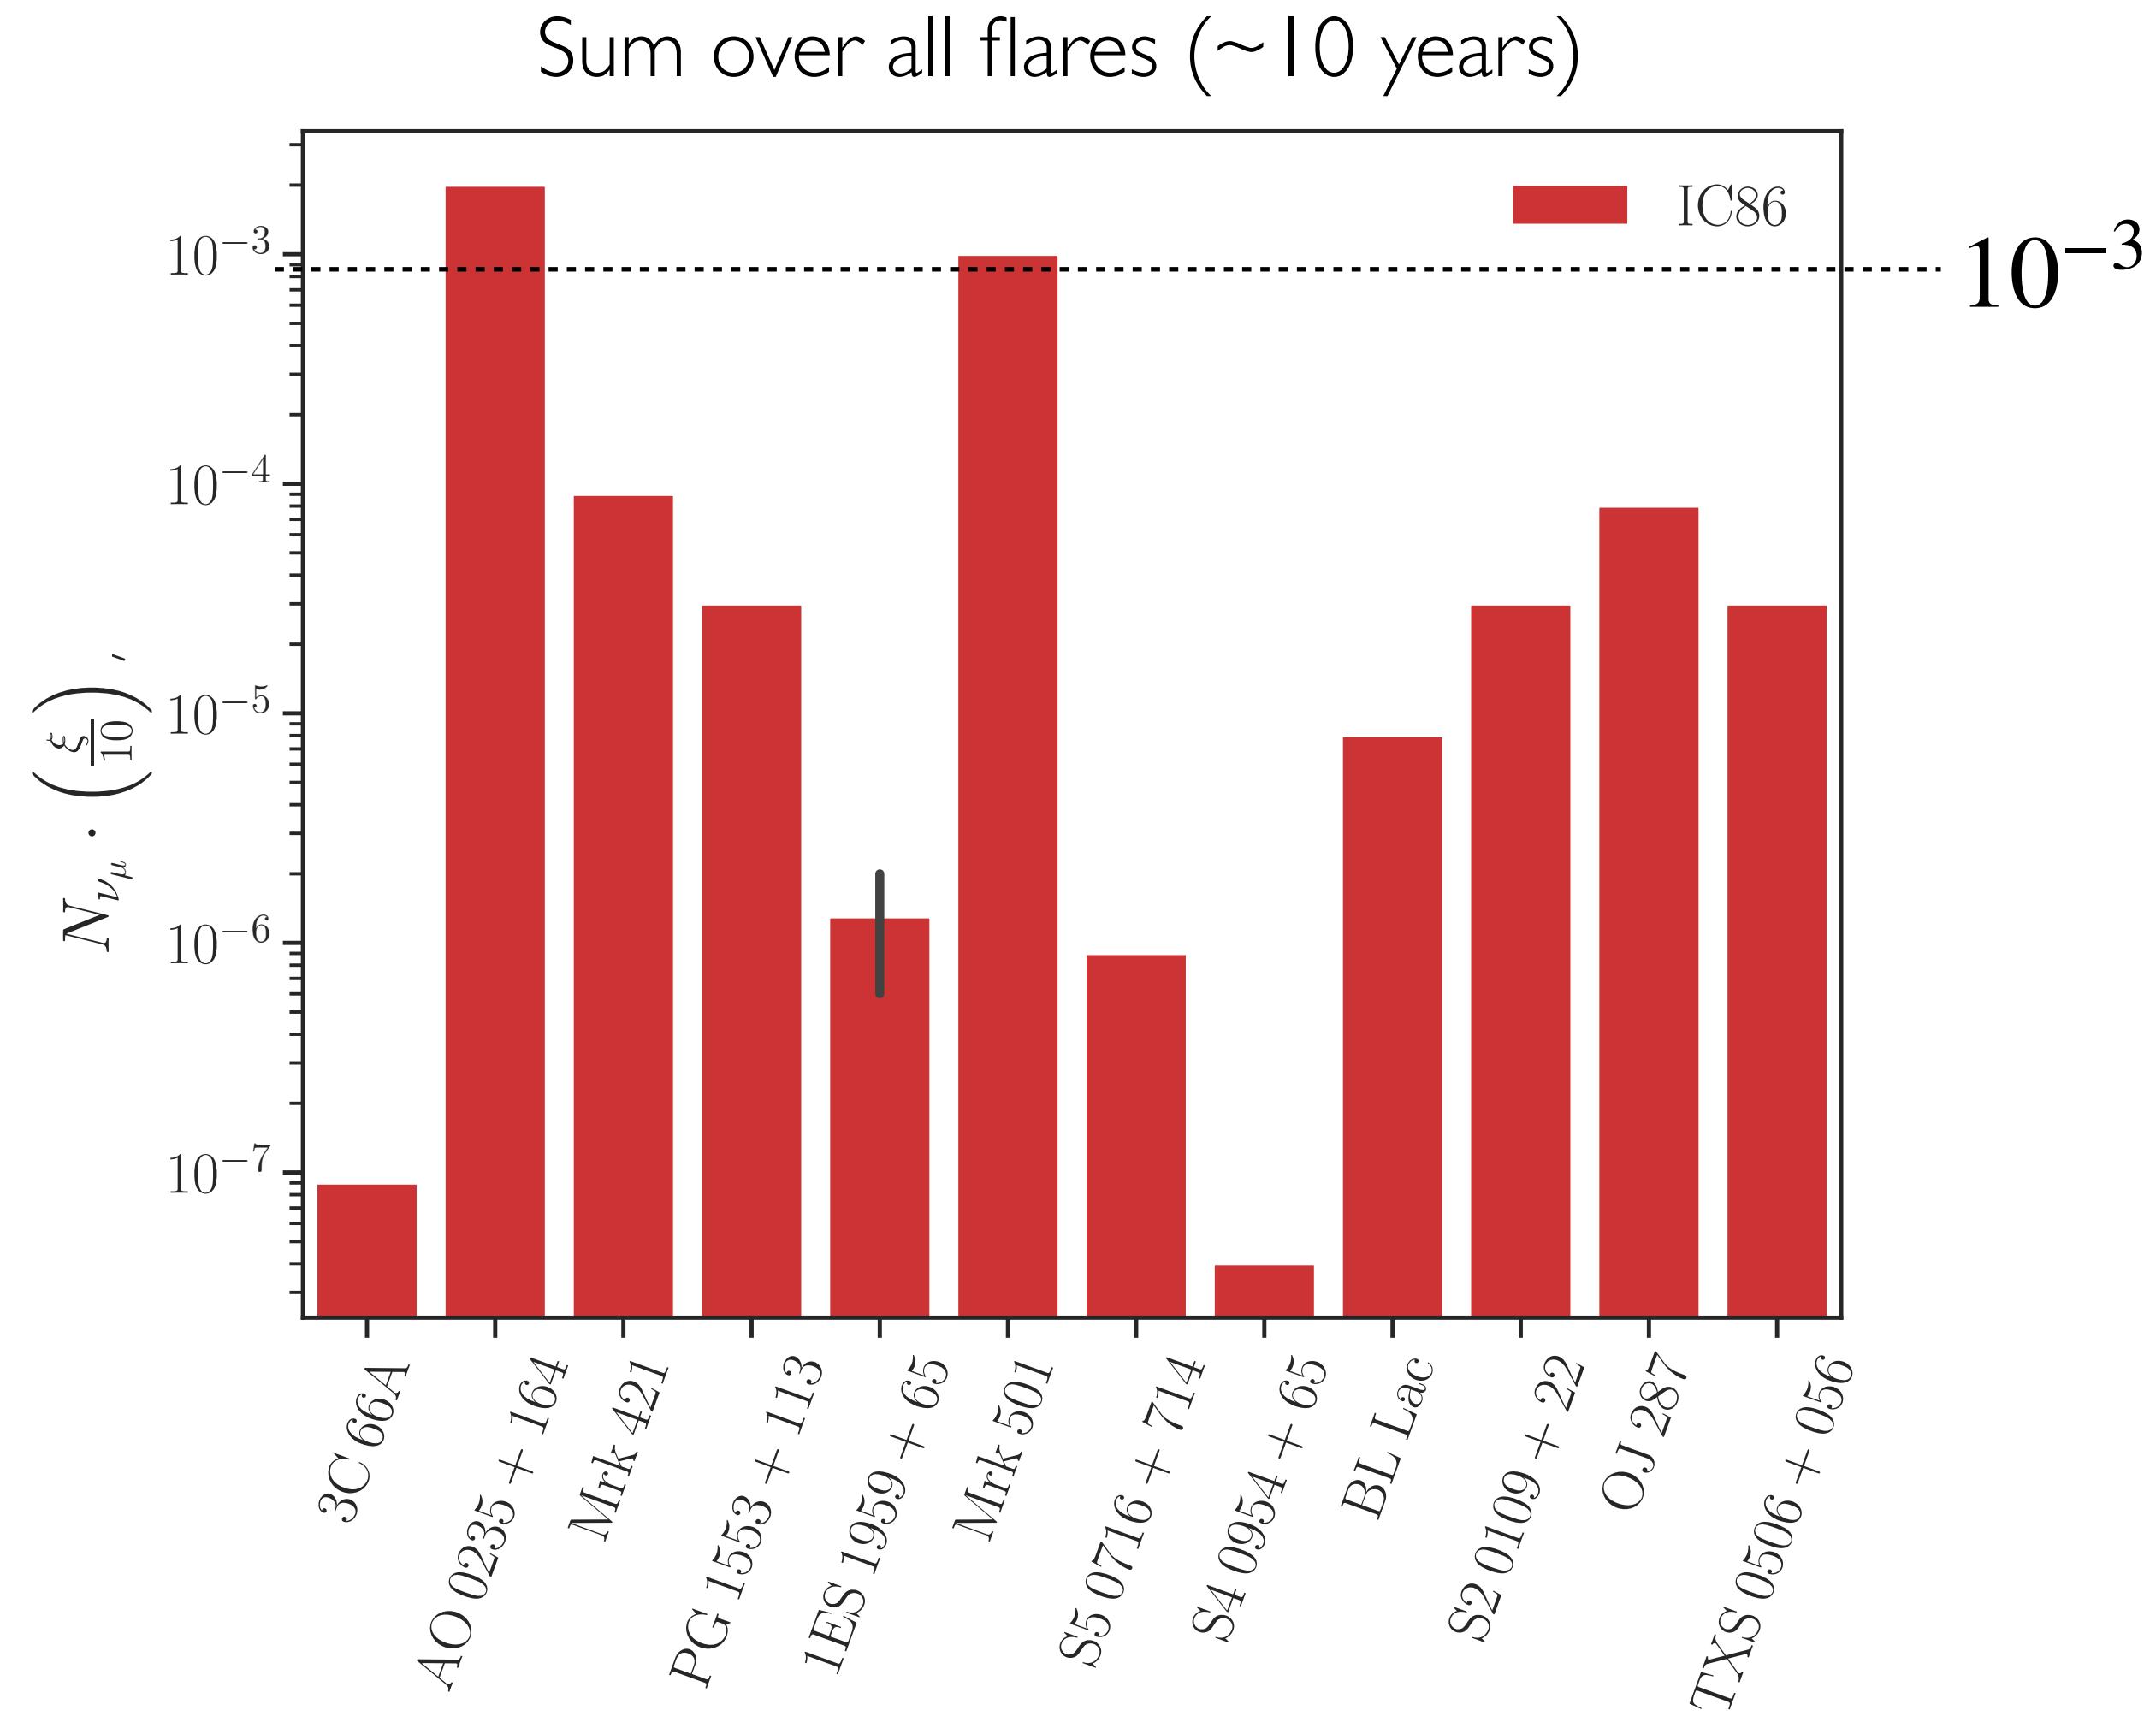

Scenario A

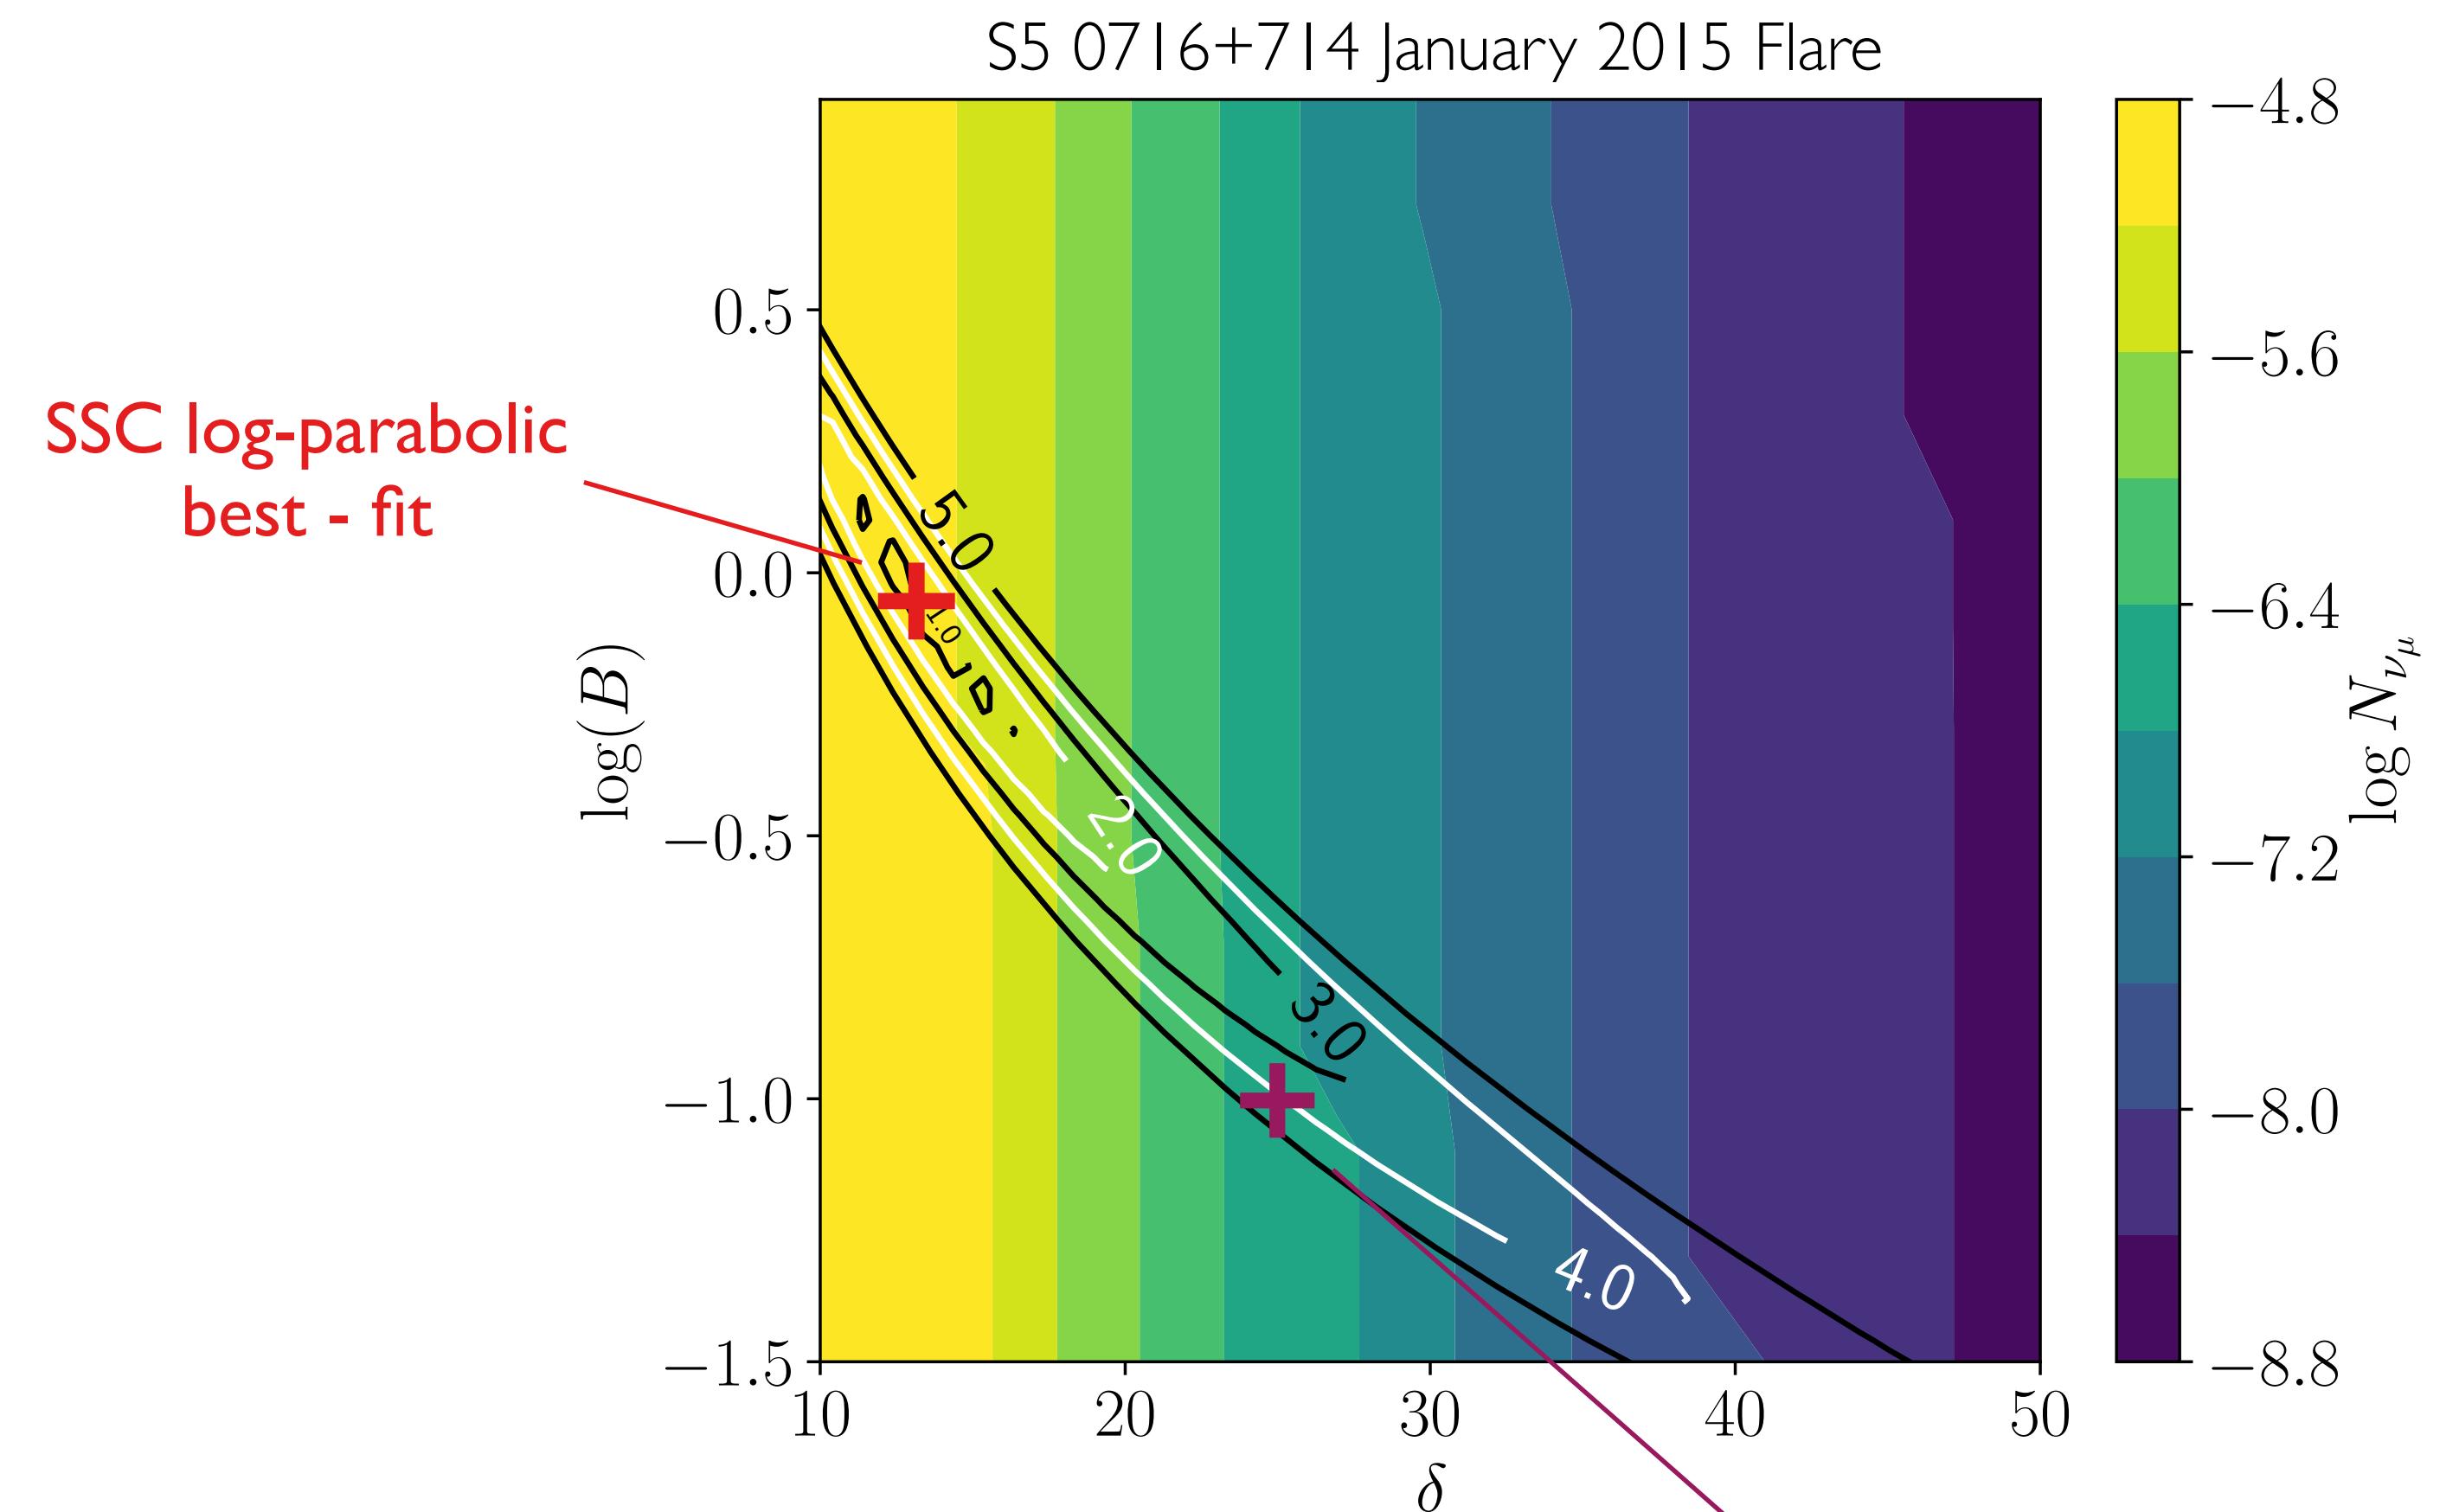

*Number of throughgoing $\nu_\mu / \bar{\nu}_\mu$ expected in IC40/59/79/86 with A_{eff} of IceCube Coll 2019, *Eur. Phys. J.*, C79, 234

Scenario A

*Number of throughgoing $\nu_\mu / \bar{\nu}_\mu$ expected in IC40/59/79/86 with A_{eff} of IceCube Coll 2019, Eur. Phys. J., C79, 234

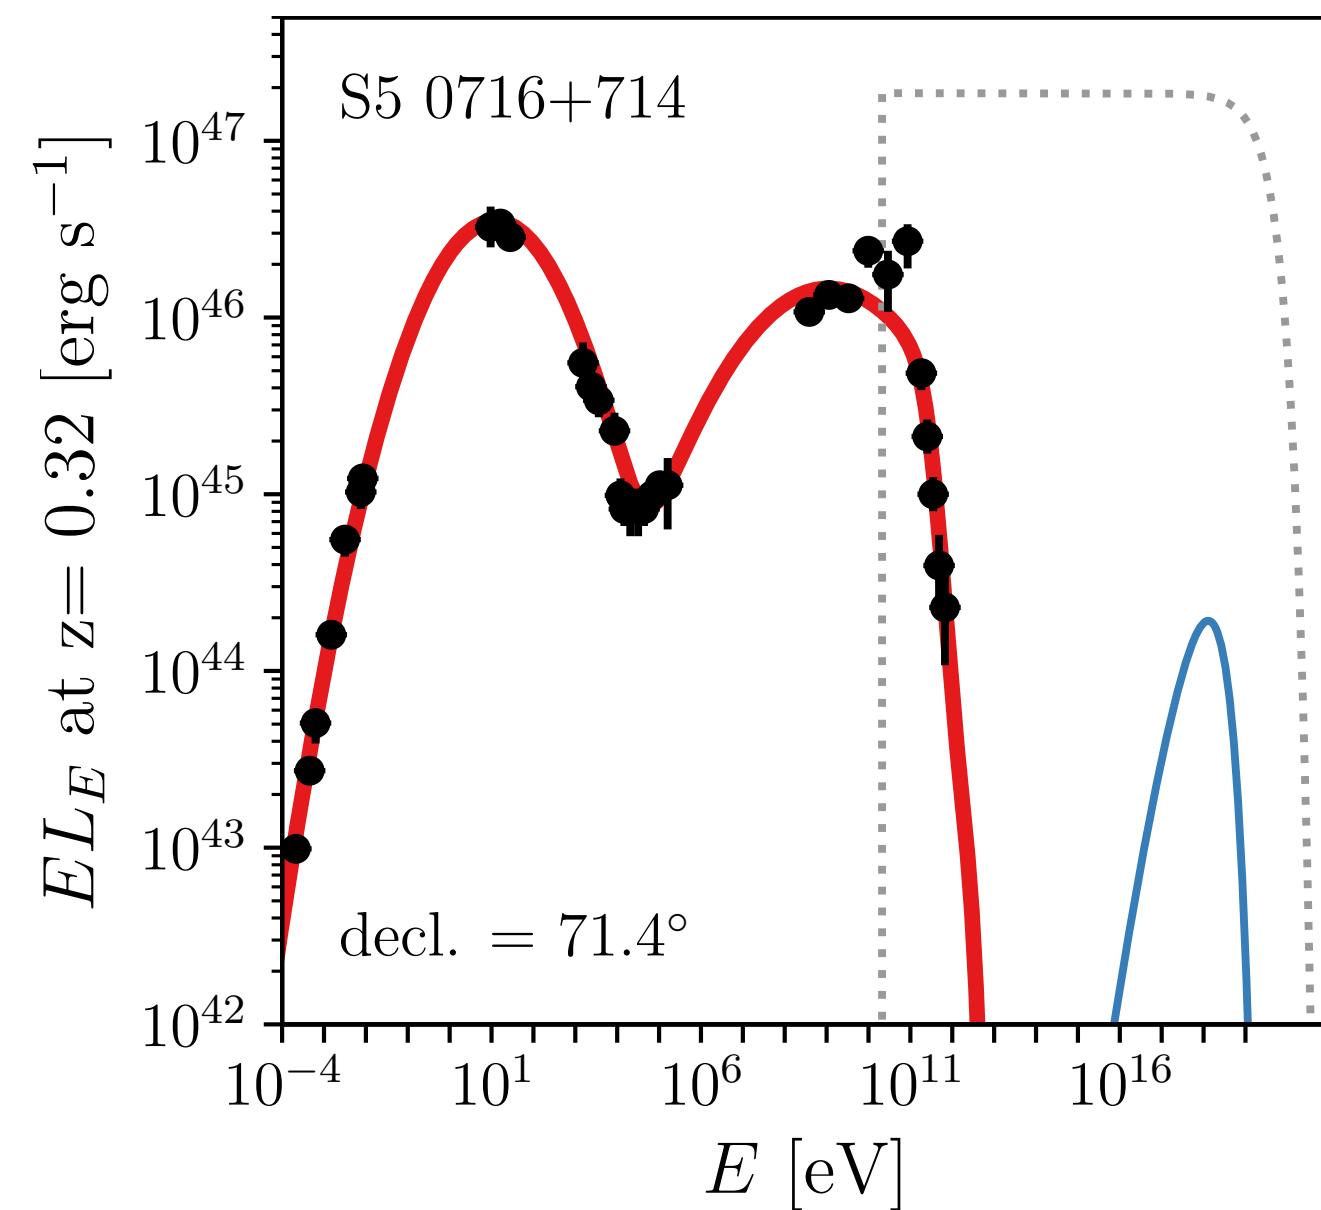

The effect of systematic uncertainties on N_{ν_μ}

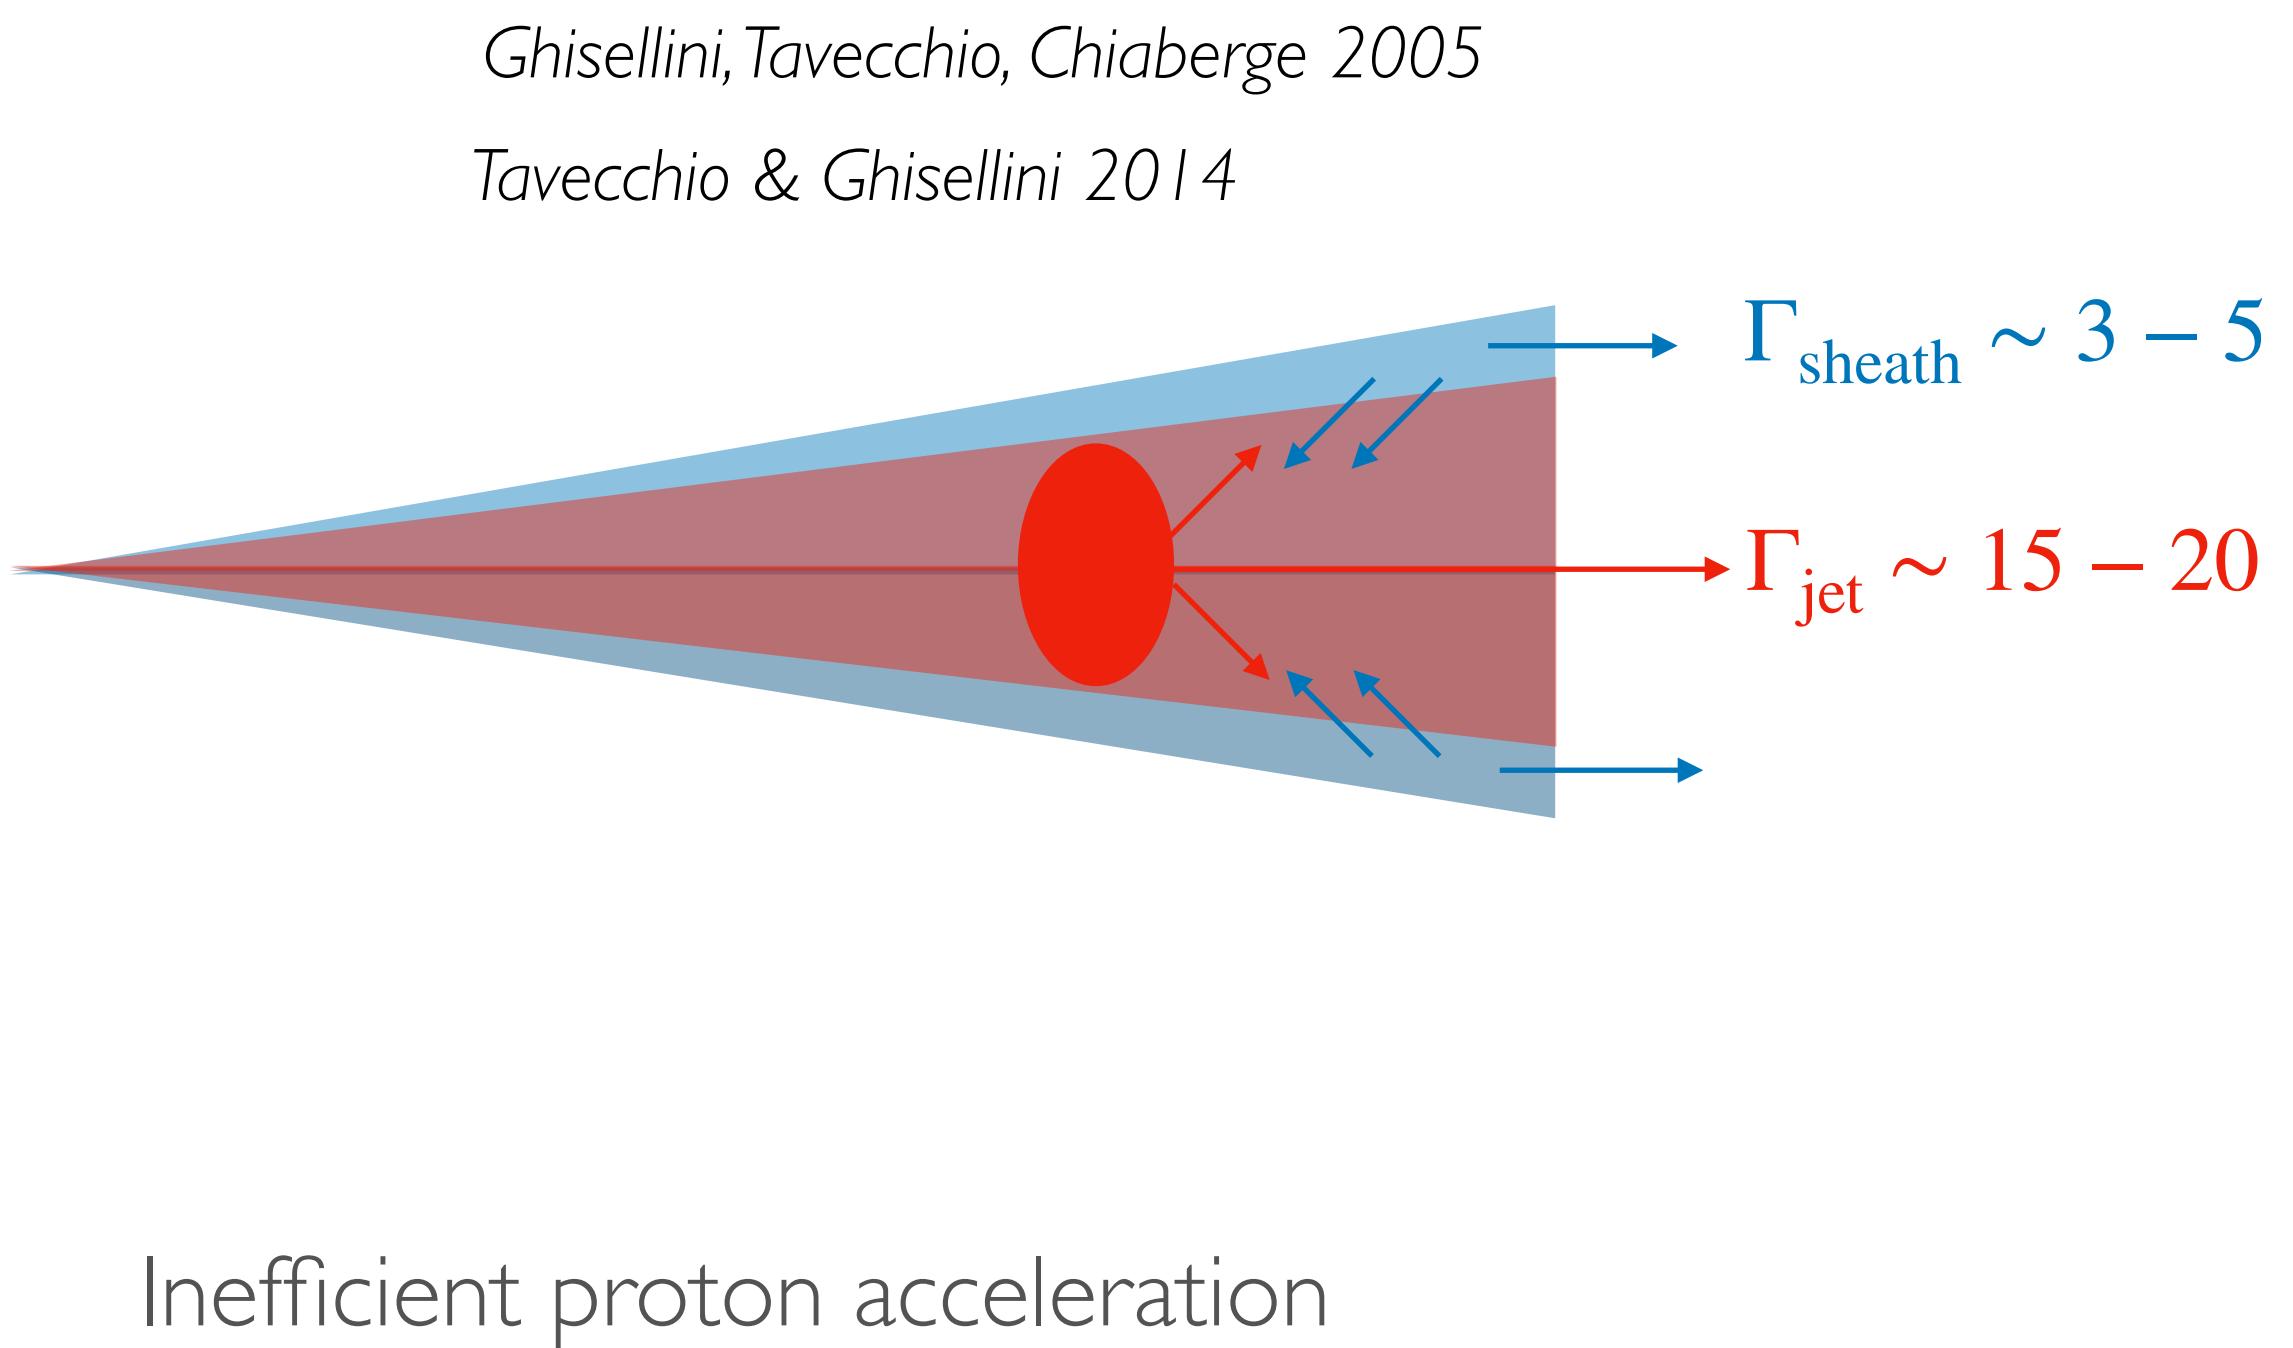

$$\delta = 1/[\Gamma(1 - \beta \cos \theta)] \sim \Gamma \text{ (for small } \theta)$$

Superluminal motion, $L_{\text{obs}} = \delta^4 L_{\text{jet frame}}$

MAGIC Coll 2018

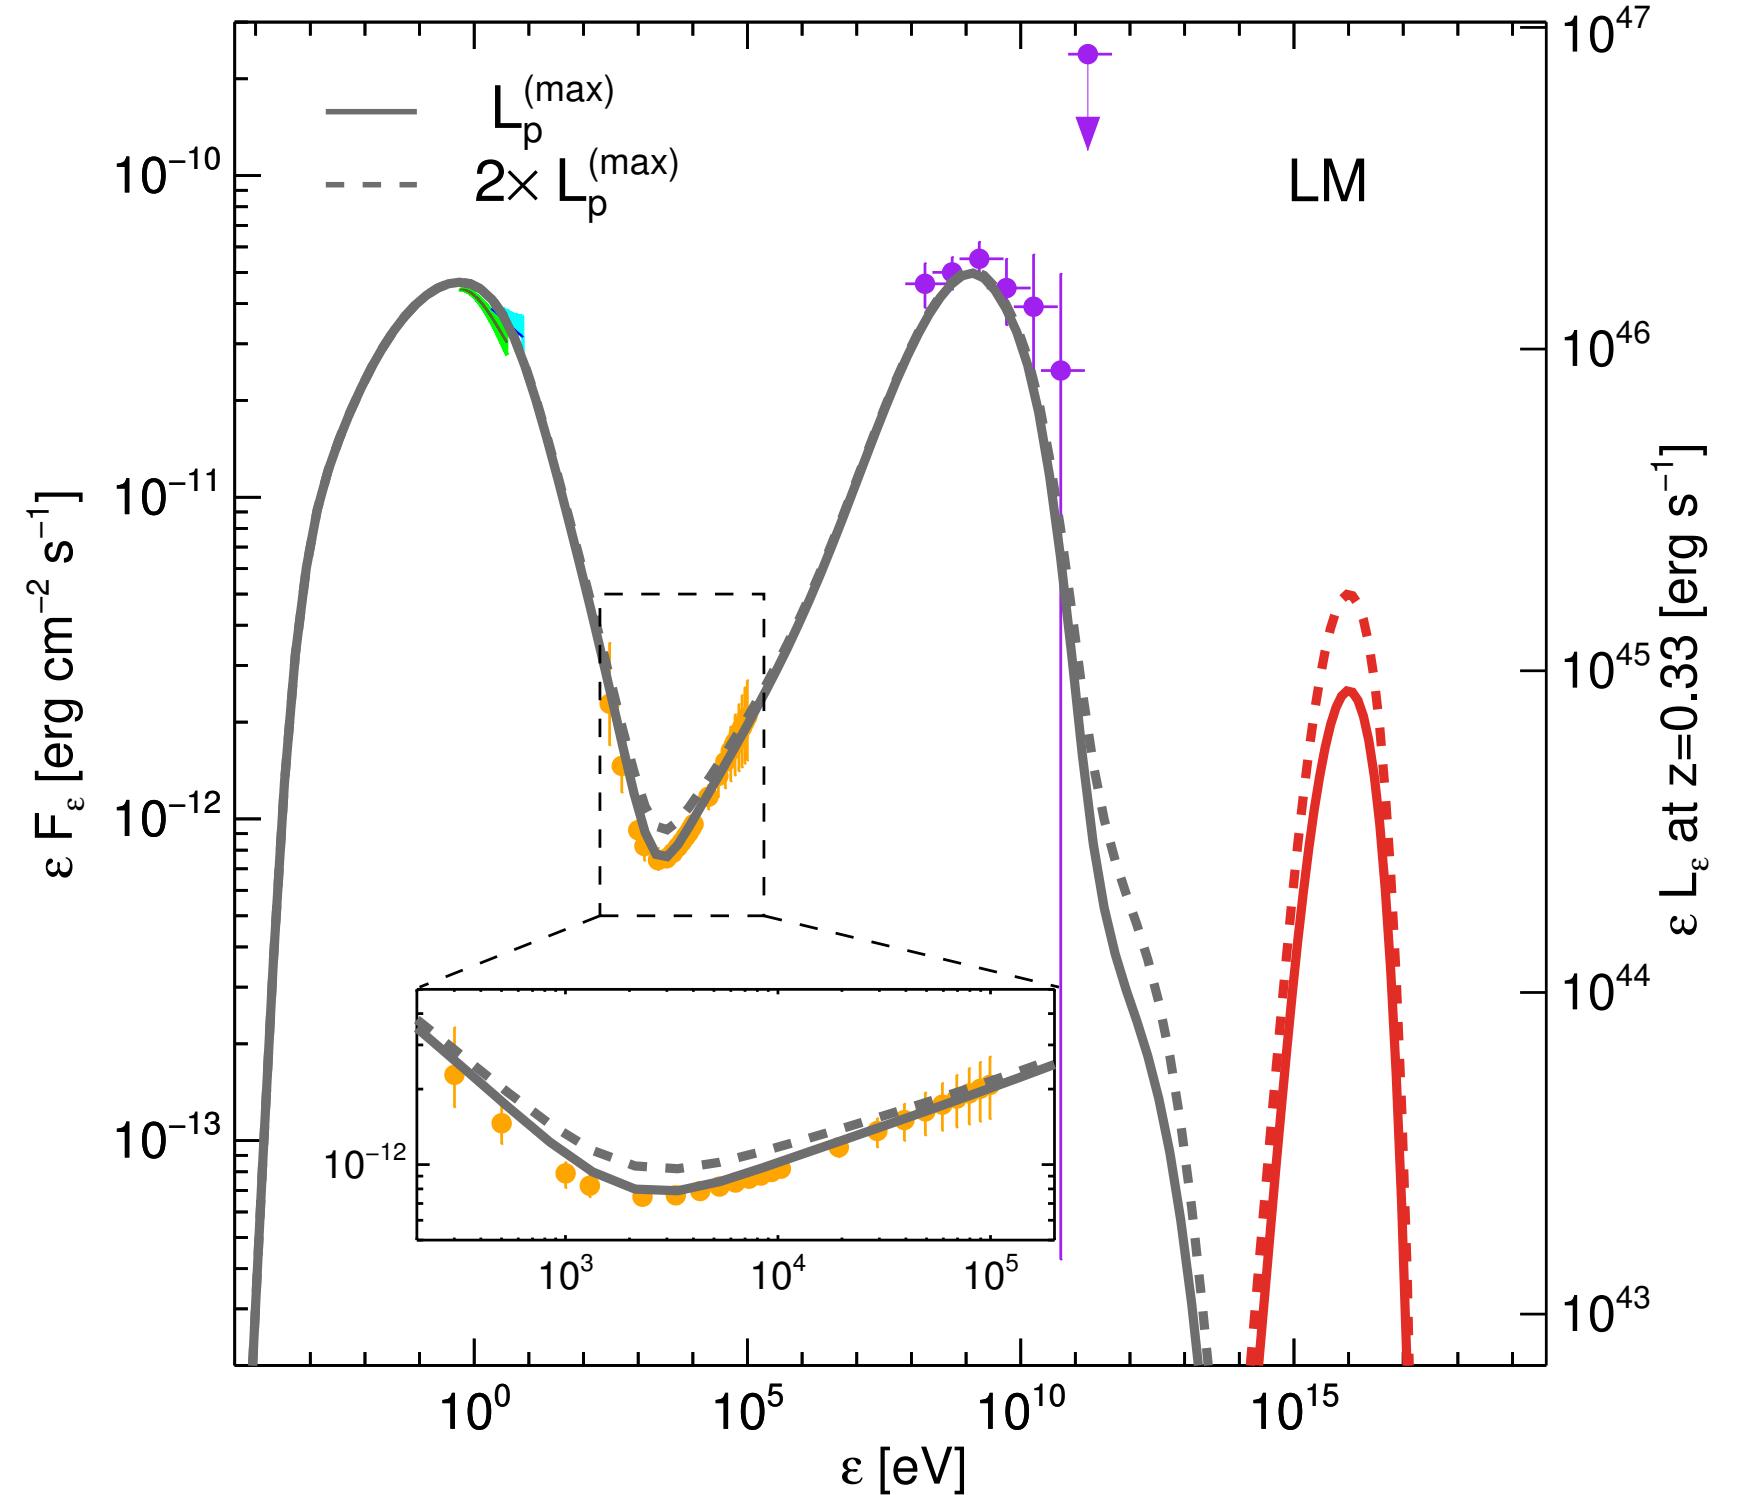

Scenario B

$$E_{\text{CR,max}} \sim \left(\frac{\eta}{10^{-4}} \right) \left(\frac{B}{0.35 \text{ G}} \right) \left(\frac{R'}{10^{16} \text{ cm}} \right) \left(\frac{\Gamma}{25} \right) \sim 5 \times 10^{15} \text{ eV}$$

Keivani et al, 2018, *ApJ*, 864, 84

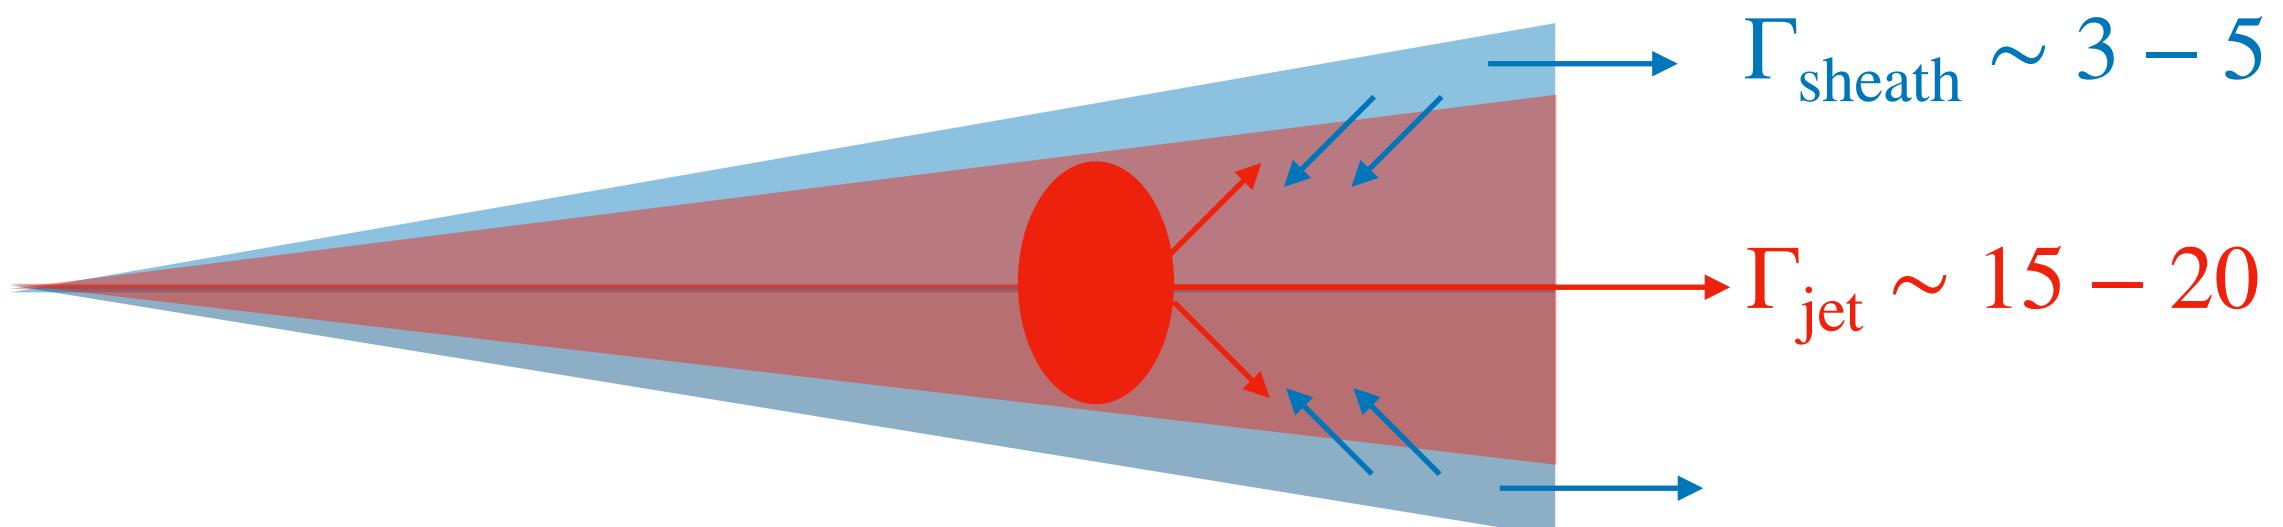

(see also MAGIC Coll. *Astrophys.J.* 863 (2018) L10)

Baryon loading = 1500
 (Based on LMPL2B model of
 Keivani et al, 2018, *ApJ*, 864, 84)

Scenario B

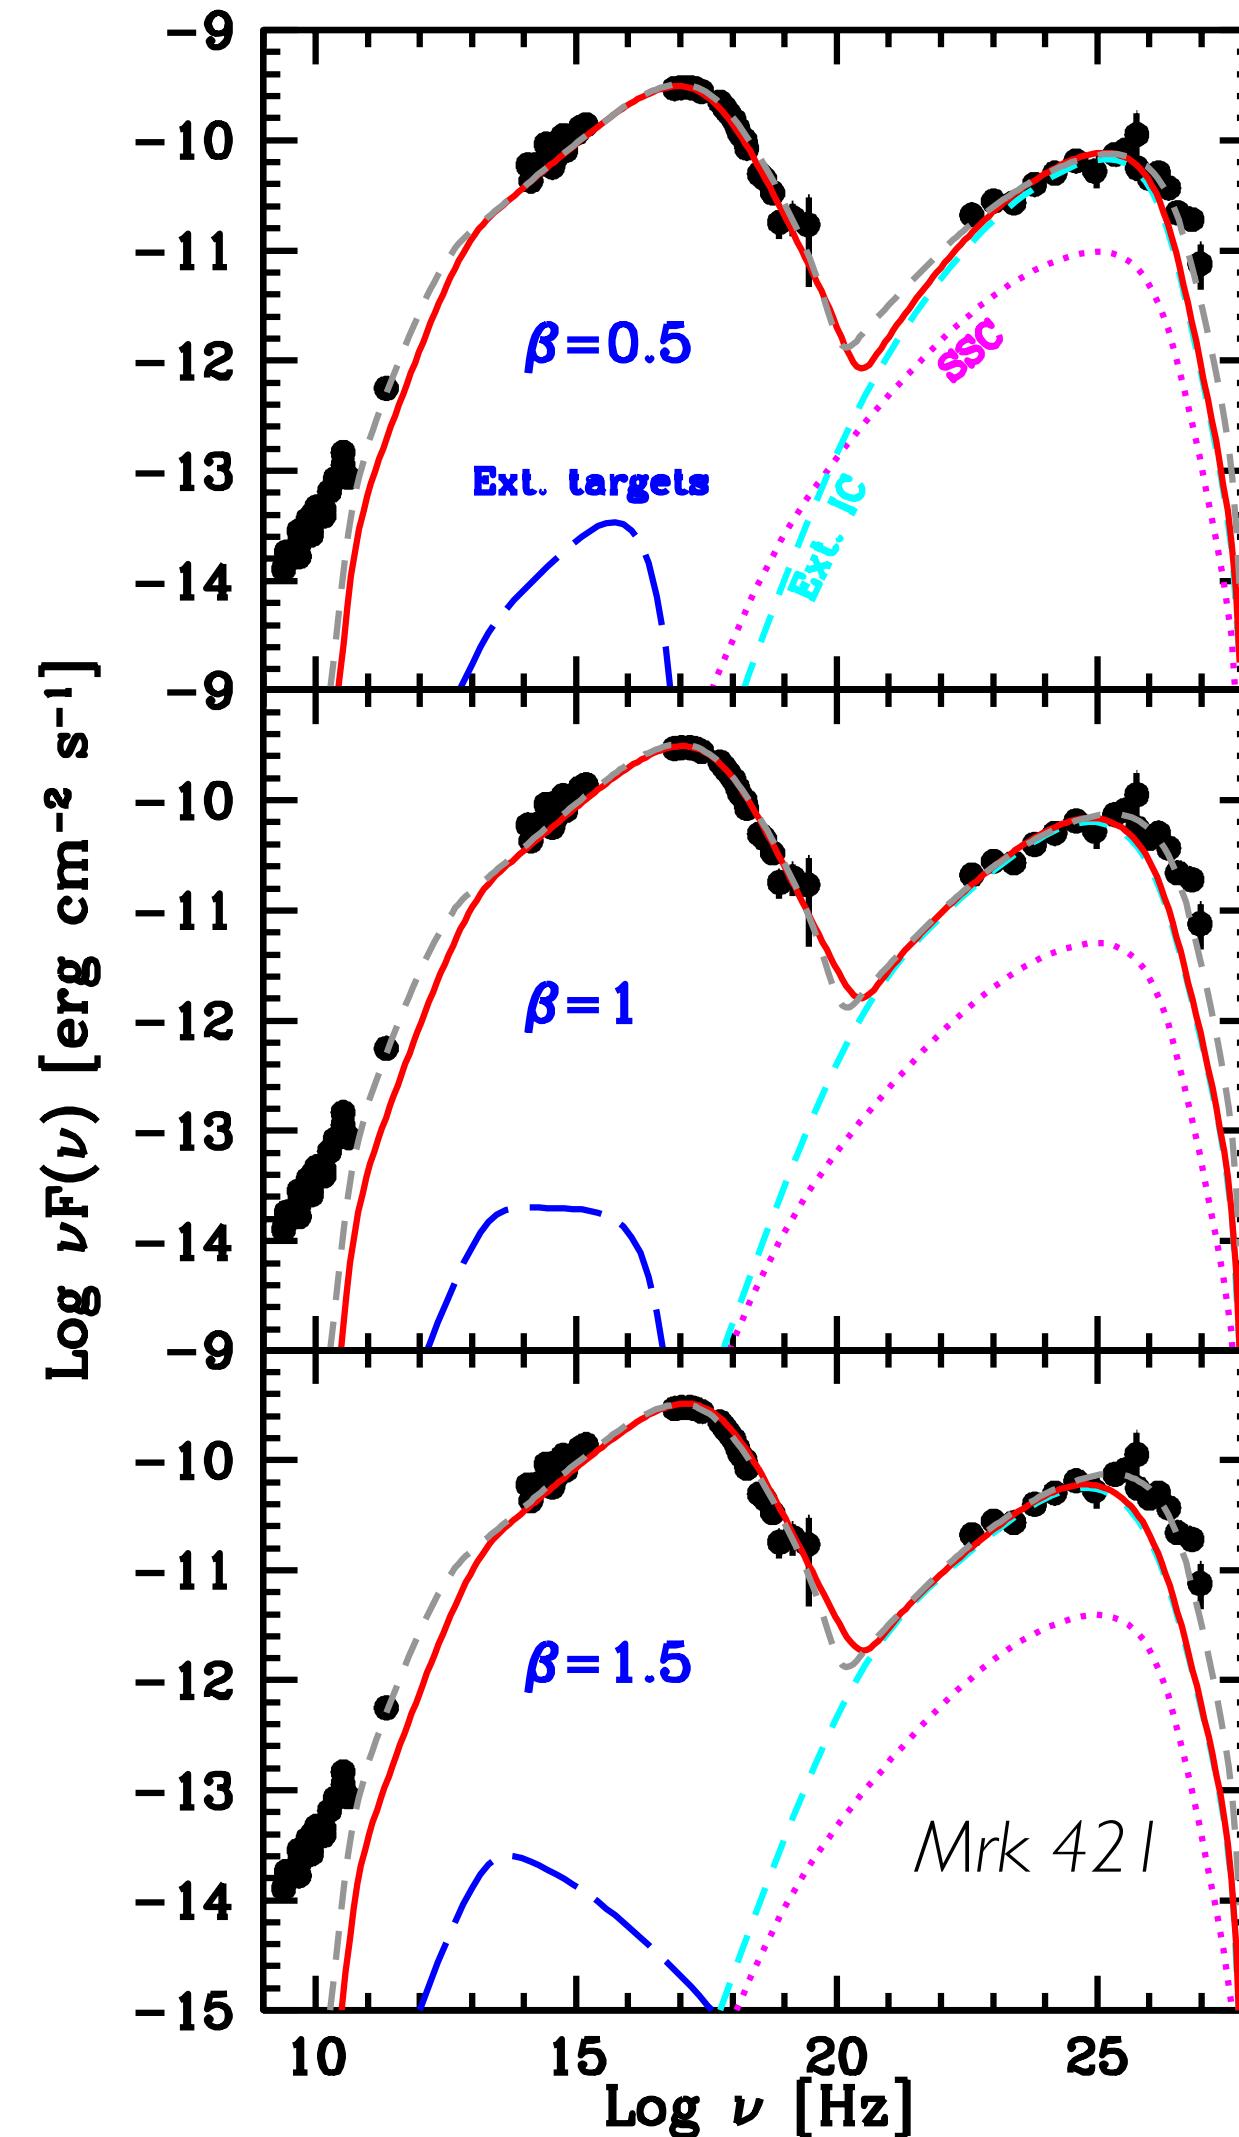

Ghisellini, Tavecchio, Chiaberge 2005
Tavecchio & Ghisellini 2014

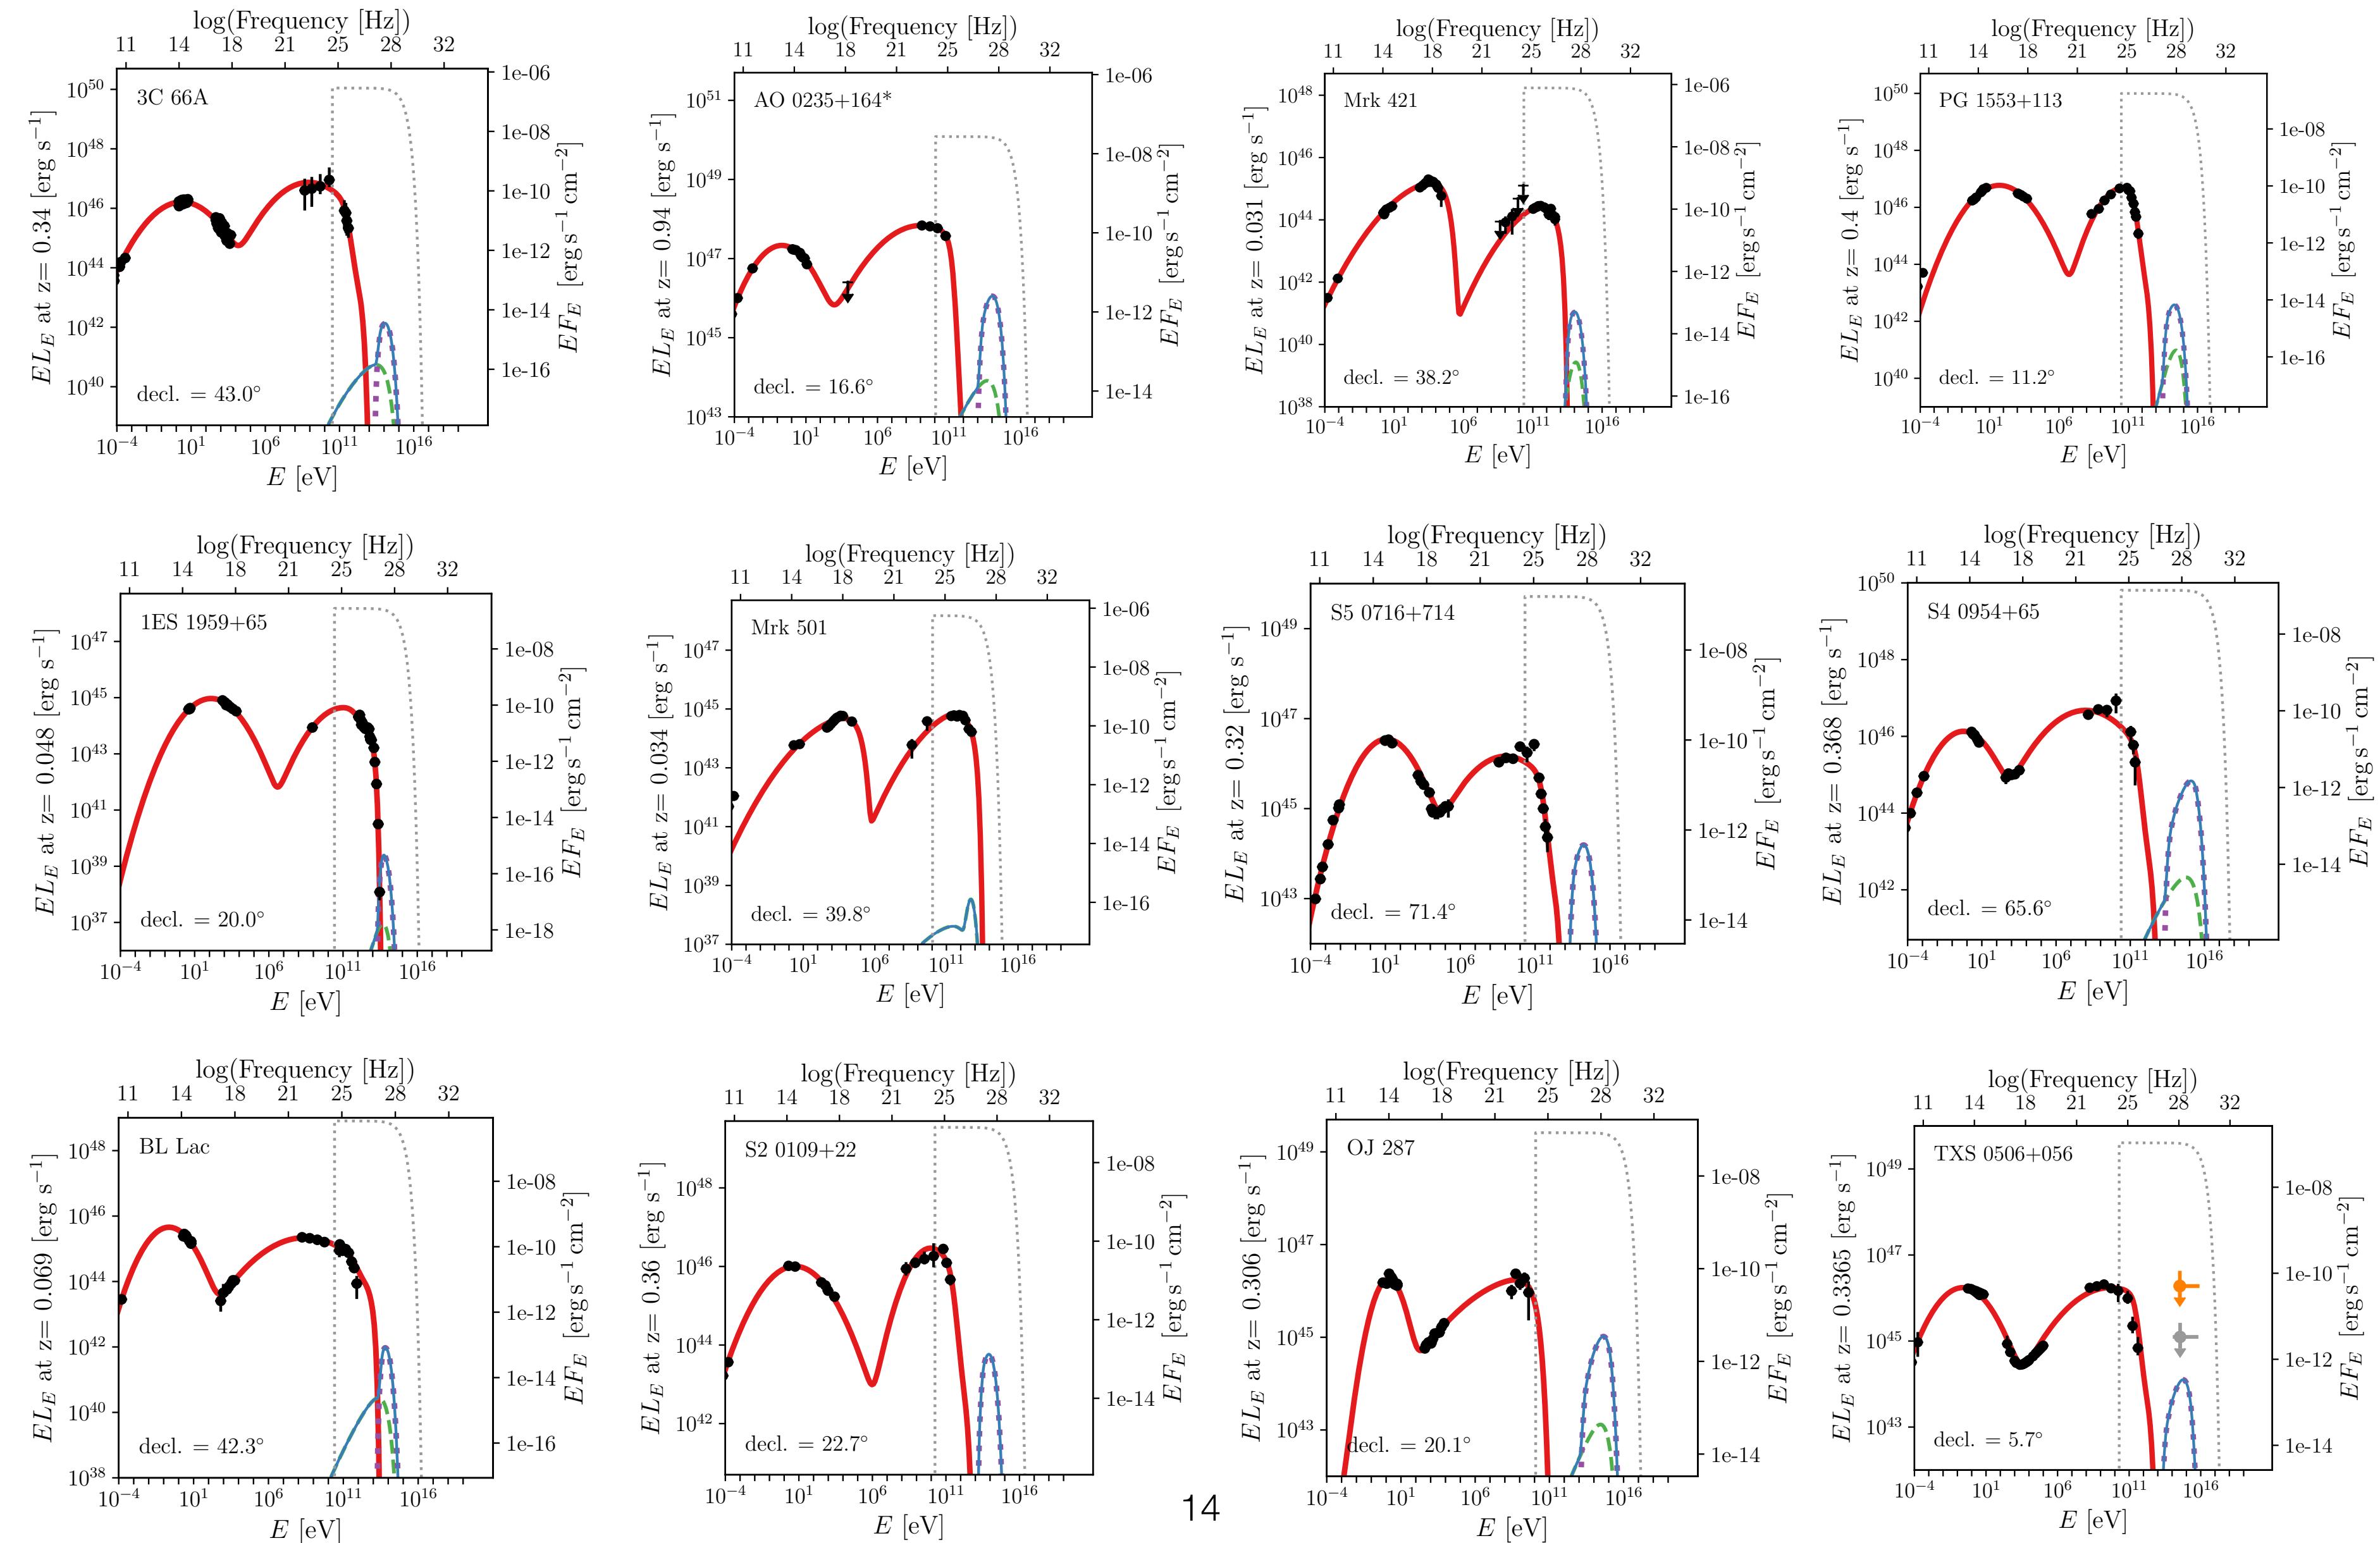

Inefficient proton acceleration

$$E_{\text{CR,max}} \sim \left(\frac{\eta}{10^{-4}} \right) \left(\frac{B}{0.35 \text{ G}} \right) \left(\frac{R'}{10^{16} \text{ cm}} \right) \left(\frac{\Gamma}{25} \right) \sim 5 \times 10^{15} \text{ eV}$$

Summary

- Individual or stacked flares challenging to detect with IceCube in simple lepto-hadronic scenarios
- TXS 0506+056 like flares identifiable with next generation detectors or constraining upper limit to proton content
- Strong dependence of neutrino expectation on physical parameters (baryon loading, doppler factor, magnetic field strength, external photon field energy density)
- To identify the brightest neutrino flares precise astronomical measurements needed
