Particle Acceleration in Supernova Remnants

- Shock front as SN ejecta interact with stellar winds and ISM.
- Efficient particle acceleration. •
- Sufficient energy budget to produce bulk of Galactic CRs.

SNRs as Sources of Cosmic Rays

- So far, two SNRs are known to emit gamma rays dominantly produced by hadronic processes.
- Do all SNRs accelerate protons/nuclei? How efficiently?
- Maximum acceleration energy?
- Need spectral coverage from ~100 MeV to ~10 TeV or more.

- 279 radio-detected SNRs considered for 1SC.
- 30 with spatially associated GeV source, classified as SNRs. •

Baseline: "The First Fermi-LAT Supernova Remnant Catalog" (Acero et al. 2016, ApJS)

- 17 SNRs in HAWC's field of view.
- 9 in (relatively) isolated regions.

Source Selection

| Name | GeV Radius | TeV association (TeVCat) | isolated | HAWC detection |
|---------------|-------------------|---------------------------------|----------|----------------|

SNR 180.0-01.7

HAWC Analysis: Y Cygni SNR

- Cygnus Cocoon region.
- Multiple overlapping sources.
- More details on multi-source analysis:
 - B. Hona, GA-I 7d (7/29, 5:15 PM, here)
 - H. Fleischhack, PS1-64 (Tripp Commons, 2nd floor).

Hadronic Modeling: Y Cygni SNR

Update with 4FGL...

Conclusions

- Searched for TeV gamma-ray emission from GeV-detected SNRs.
- Detected three SNRs, upper limits placed for the remaining six. •
- For three detected and three non-detected SNRs, HAWC measurements or upper limits imply break or cutoff in the gamma-ray spectrum.
- More detailed studies and modeling ongoing.
